Ni Ni,

Matt Tillman, Eun-Deok Mun

At a gross level, the past couple of decades of research in superconductivity have been a process of shedding (or destroying) prejudices.

Discovery

Prejudice countered

High T_c

Superconductivity in oxides will not rival intermetallics

RT_2B_2C

Superconductivity in intermetallics is dead

MgB_2

Superconductivity in intermetallics cannot exceed $T_c \sim 30$, $N(E_F)$ vital for high T_c in intermetallics

The recent work in FeAs based superconductors continues this trend.

FeAs
compounds

“Really high T_c ” superconductivity is found in oxides and specifically copper oxides

At a gross level, the past couple of decades of research in superconductivity has confirmed (or at least preserved) one old prejudice: extremes in superconductivity are found near (often in competition with) other phase transitions.

High T_c

Cu-based magnetism

RT_2B_2C

Strong phonon softening / structural phase transitions

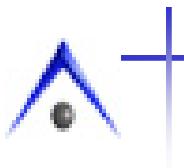

MgB_2

At the extreme of the AlB_2 structure's stability (i.e. structural phase transition)

The recent work in FeAs based superconductors continues this trend.

FeAs compounds

Structural / antiferromagnetic transition

Fe-As based superconductors part I

The end of the tyranny of copper

$RFeAs(O_{1-x}F_x)$

T_c up to 55 K

$RFeAsO_{1-x}$

T_c up to ~ 50 K

Hard to make, is this oxide physics, intermetallic physics, both, neither...?????

What is role of O / F?

What is the nature of the superconductivity, what is the symmetry of the gap?

Superconductivity in FeAs compounds was years in the making....

Journal of Alloys and Compounds 302 (2000) 70–74

Quaternary rare earth transition metal arsenide oxides $RT\text{AsO}$ ($T=\text{Fe, Ru, Co}$) with ZrCuSiAs type structure

Iron-Based Layered Superconductor: LaOFeP

Published on Web 07/15/2006

Yoichi Kamihara,[†] Hidenori Hiramatsu,[†] Masahiro Hirano,^{†,‡} Ryuto Kawamura,[§] Hiroshi Yanagi,[§] Toshio Kamiya,^{†,§} and Hideo Hosono^{*,†,‡}

Iron-Based Layered Superconductor $\text{La}[\text{O}_{1-x}\text{F}_x]\text{FeAs}$ ($x = 0.05\text{--}0.12$) with $T_c = 26\text{ K}$ Yoichi Kamihara,^{*†} Takumi Watanabe,[‡] Masahiro Hirano,^{†§} and Hideo Hosono^{†‡§}

VITAL POINT TO MAKE:

New materials with wonderful properties do not “just appear by accident”.

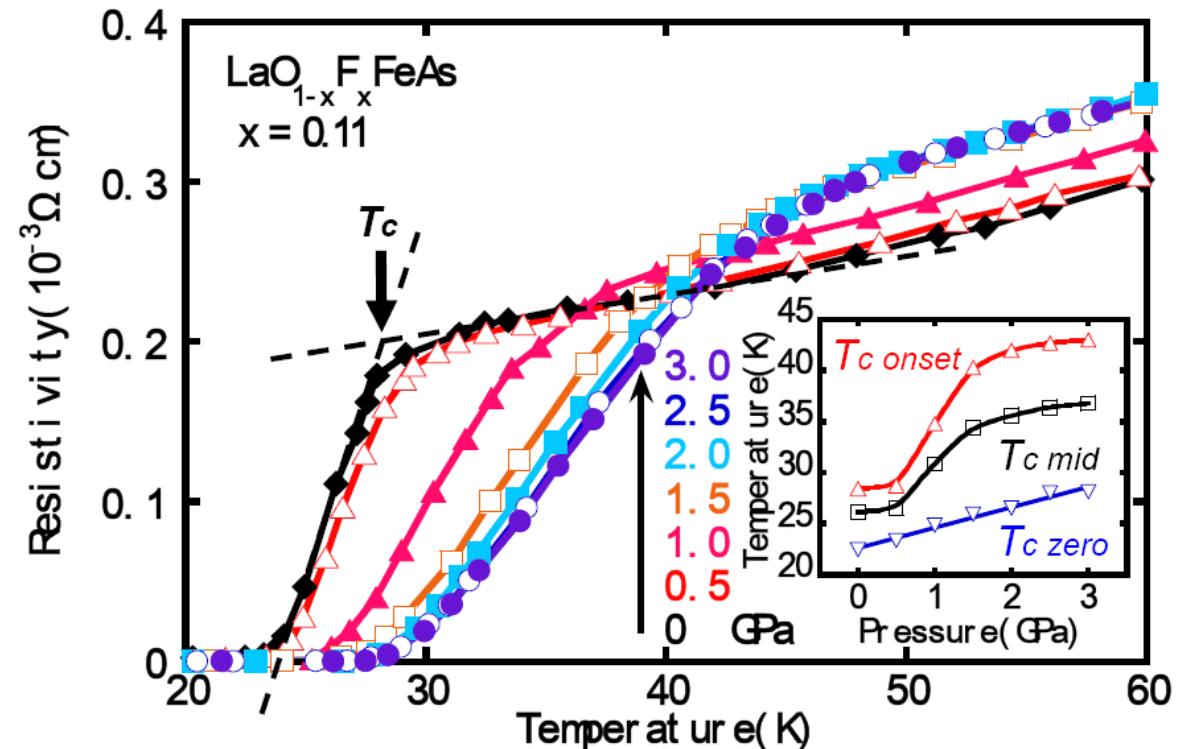

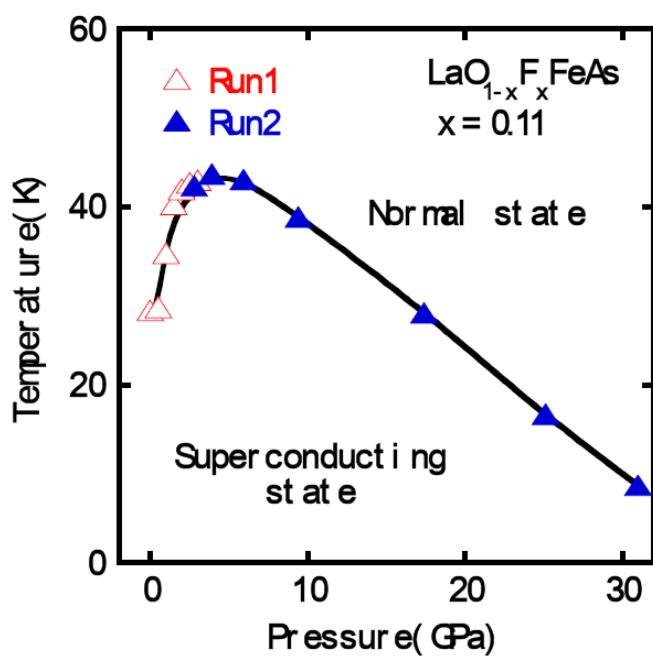

Superconductivity in $\text{LaFeAs(O}_{1-x}\text{F}_x\text{)}$ was the result of a career of new materials discovery (Jeitschko) and a several year campaign of looking for superconductivity in compounds with square-planar Fe (Hosono).

As will be discussed below, the extension to square planar members of the ThCr_2Si_2 was made simple by decades worth of work on this well known family of ternary intermetallics.

FeAs superconductivity is another example of basic research at its finest. Long term efforts to extend our knowledge of novel and complex materials, coupled with focused searches for specific properties, result in important discoveries.

With the basic discovery made, the question becomes can the properties be improved?

T_c can be tuned with pressure...A LOT!!

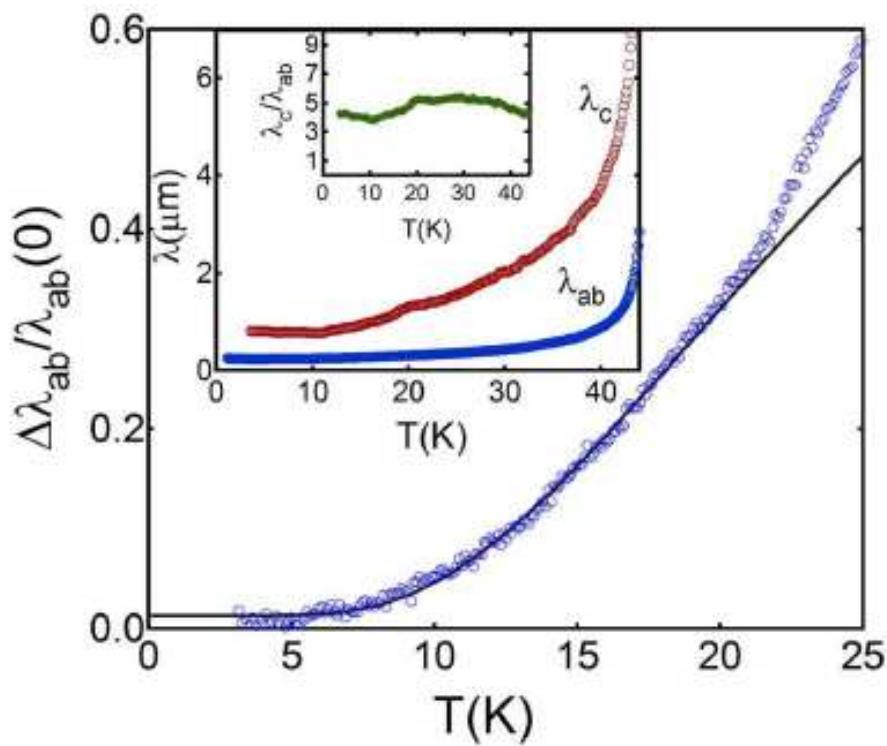

FIG. 3: (Color online) Low temperature region of $\Delta\lambda_{ab}/\lambda_{ab}(0)$. The solid line is the best fit to Eq. (1). The inset shows $\lambda_{ab}(T)$ and $\lambda_c(T)$. The smaller inset shows the ratio $\gamma_\lambda = \lambda_c(T)/\lambda_{ab}(T)$.

$$\frac{\Delta\lambda(T)}{\lambda(0)} = \sqrt{\frac{\pi\Delta_0}{2T}} \exp\left(-\frac{\Delta_0}{T}\right). \quad (1)$$

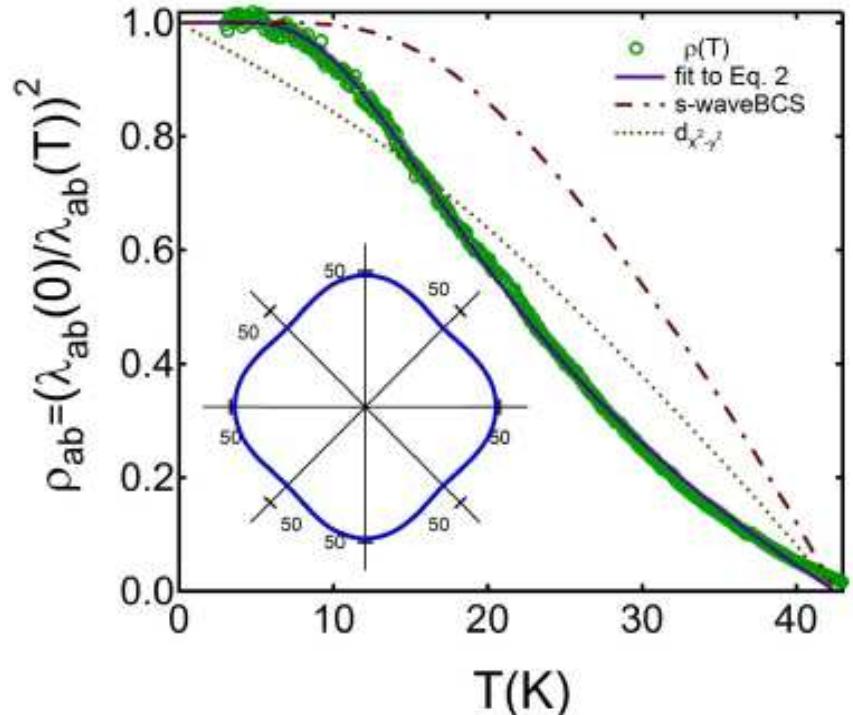

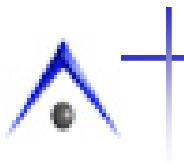

FIG. 4: (Color online) The in-plane superfluid density vs. temperature (symbols). Solid line is a fit to an anisotropic gap described by Eq. 3. The inset shows the angular dependence of the fitting gap. The s-wave BCS (lines and dots) and pure d-wave (dotted line) superfluid densities are plotted for comparison.

$$\Delta(\varphi, T) = \Delta(T) \frac{1 + \varepsilon \cos(4\varphi)}{1 + \varepsilon}, \quad (3)$$

Final comments on current state of RFeAsO samples and data.

Exact knowledge of how much F goes in or how much O is missing are qualitative, or semi-quantitative at best.

All polycrystalline samples are mixed phase to some extent (in many cases to a very large extent).

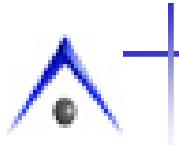

Grow of the RFeAsO compounds is very complicated and controlling O or F exacerbates this problem.

Largest single crystals / single grains are on the order of 600 μm .

A lot of work needs to be done to get samples “under control”.

There may be an intrinsic O-deficiency in these materials.

But T_c is the highest so far for these FeAs based compounds and gap appears to be without nodes, (at least for some measurements).

Fe-As based superconductors part II

Not even oxides!!!!

$(AE_{1-x}A_x)Fe_2As_2$ $T_c \sim 40$ K

$AE = Ba, Sr, Ca$ $A = K, Na, Li$

$AE(Fe_{1-x}T_x)_2As_2$ $T_c \sim 30$ K

$AE = Ba, Sr, Ca$ $T = Co, Ni, \dots$

Much easier to make (these are not oxides but true intermetallics)

What is role of A and T doping?

What is the nature of the superconductivity, what is the symmetry of the gap?

Superconductivity at 38 K in the iron arsenide $(\text{Ba}_{1-x}\text{K}_x)\text{Fe}_2\text{As}_2$

Marianne Rotter, Marcus Tegel and Dirk Johrendt*

arXiv:0805.4630v1 [cond-mat.supr-con] 29 May 2008

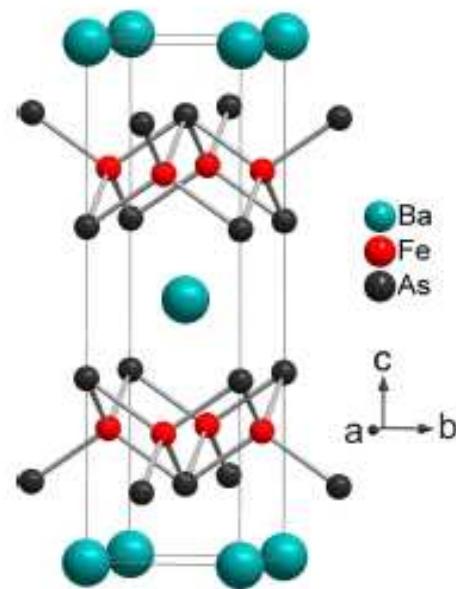

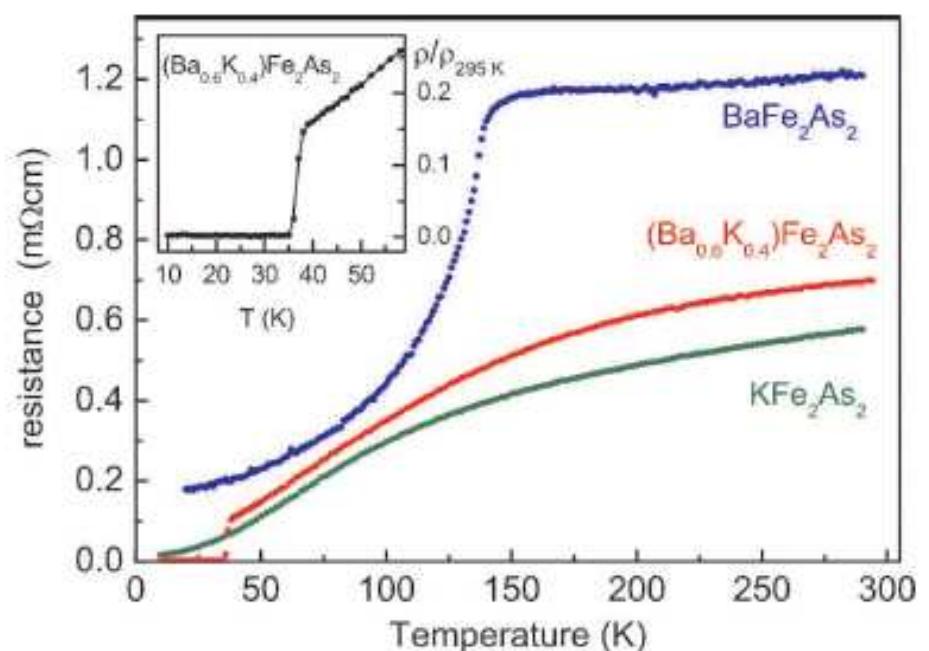

FIG. 1: Crystal structure of BaFe_2As_2 .

For BaFe_2As_2 there is a structural/AF transition that is suppressed with K-doping

In both of these structures there is a square planar sheet of Fe that is capped top and bottom with As. The A or RO layers separate these FeAs units.

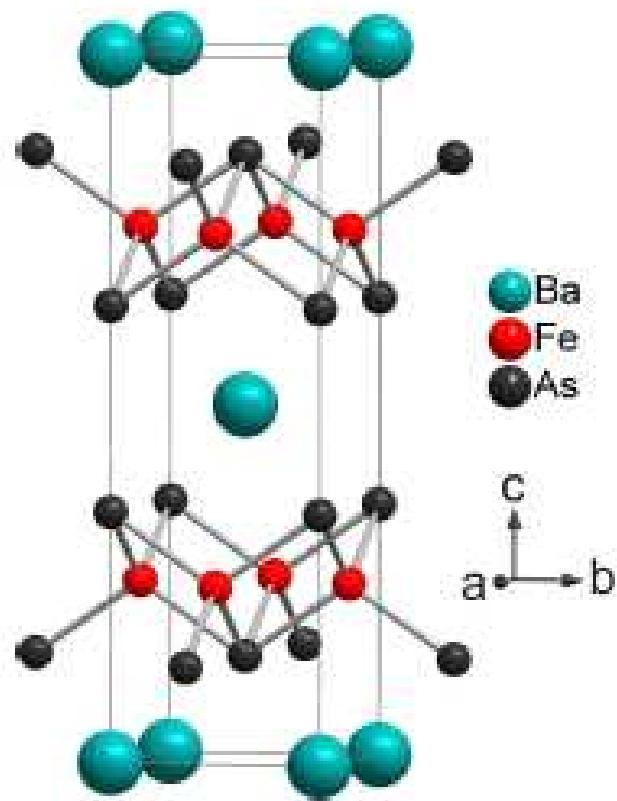

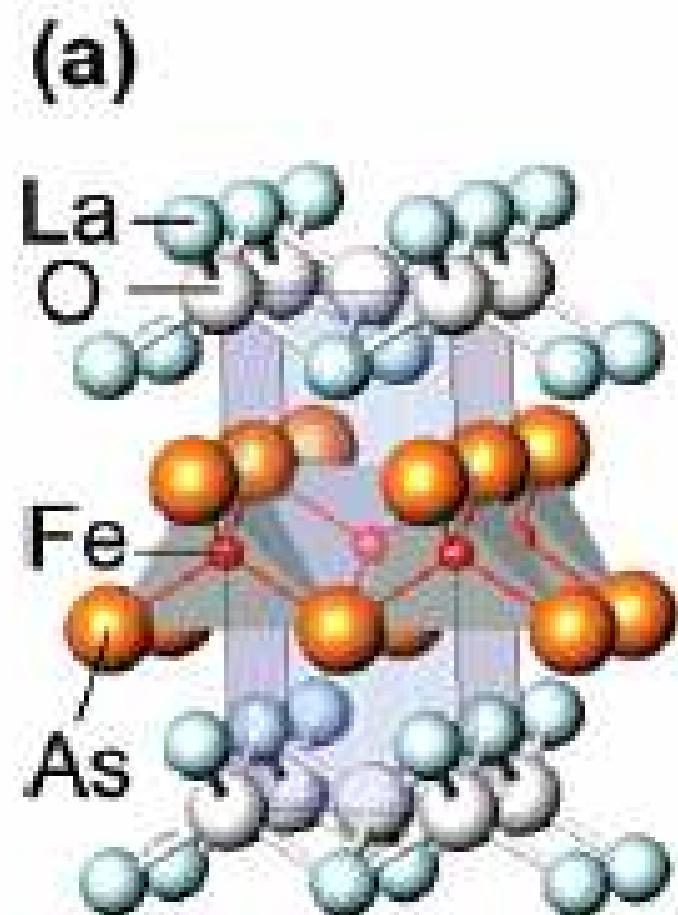

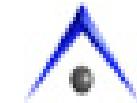

FIG. 1: Crystal structure of BaFe_2As_2 .

Within two days of reading Rotter's discovery we had grown large single crystals. Now single crystal work can really begin.

arXiv:0810.2295v1 [cond-mat.supr-con] 13 Oct 2008

Unlike $\text{NdFeAs}(\text{O}_{1-x}\text{F}_x)$, $\text{Ba}(\text{Fe}_{1-x}\text{Co}_x)_2\text{As}_2$ appear to have nodes...

The doping dependence of the structural / antiferromagnetic phase transition, as well as the doping dependence of T_c are very similar between the different families. Superconductivity appears when the structural / antiferromagnetic phase is either partially or fully suppressed.

Similar phase diagrams are found for virtually all examples of the 1111 and 122 compounds.

Both BaFe_2As_2 and SrFe_2As_2 were both known members of this structure....We decided to see if a new member could be found (and explored)

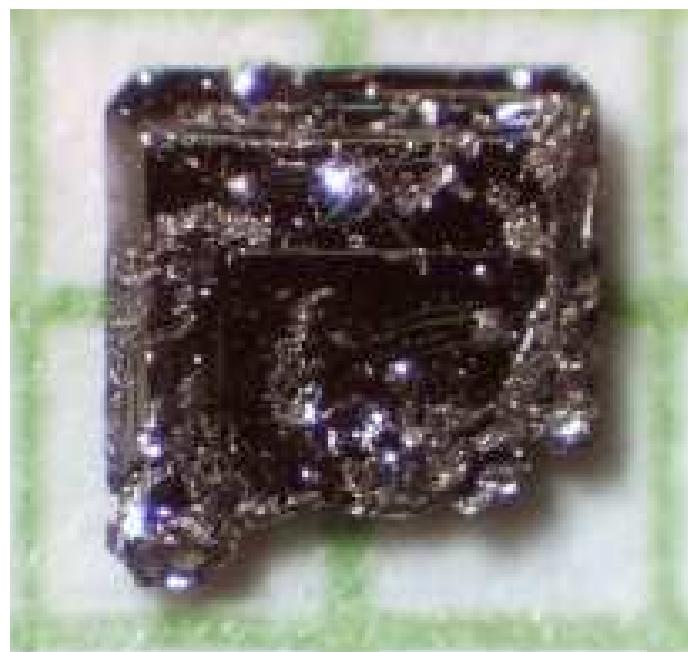

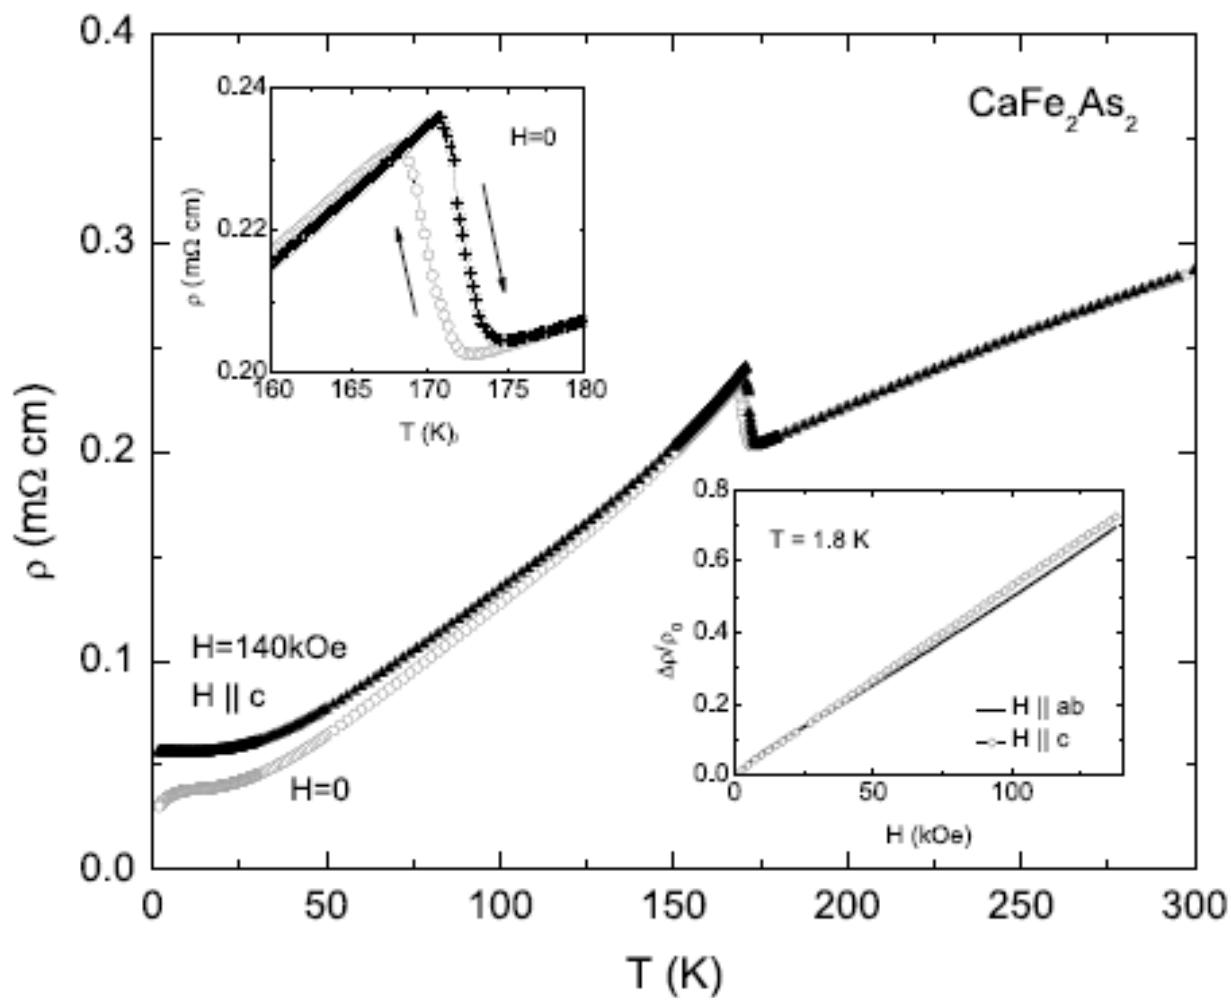

Both Ba and Sr members, when substituted with K suppressed the high temp, structural (magnetic) phase transition and became superconductors....

Strongly coupled,
first order,
antiferromagnetic
and structural
phase transitions

Observations and wishes about CaFe_2As_2

CaFe_2As_2 appears to be similar to SrFe_2As_2 and BaFe_2As_2 .

It is much softer

It has a smaller lattice parameter (Ca is smaller than Sr or Ba)

Pressure was useful in enhancing T_c in LaFeAs(O/F)

It would be wonderful to have a pure compound that could manifest all of the salient features of this system.

Pressure Induced Superconductivity in CaFe_2As_2

Milton S. Torikachvili

Department of Physics, San Diego State University, San Diego, California 92182-1233, USA

Sergey L. Bud'ko, Ni Ni, and Paul C. Canfield

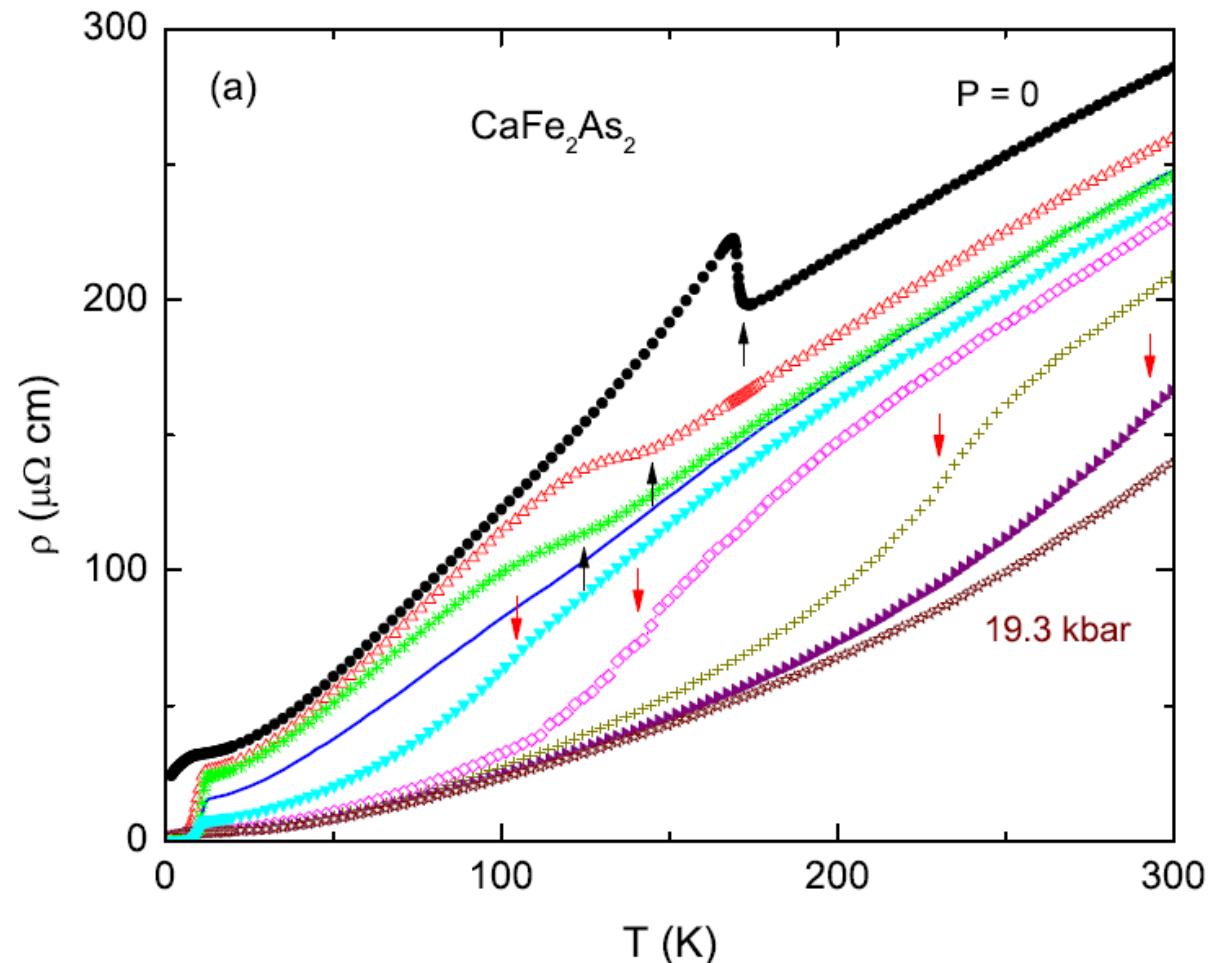

Ames Laboratory, U.S. DOE and Department of Physics and Astronomy, Iowa State University, Ames, Iowa 50011, USA

(Received 3 July 2008; published 31 July 2008)

Pure
compound

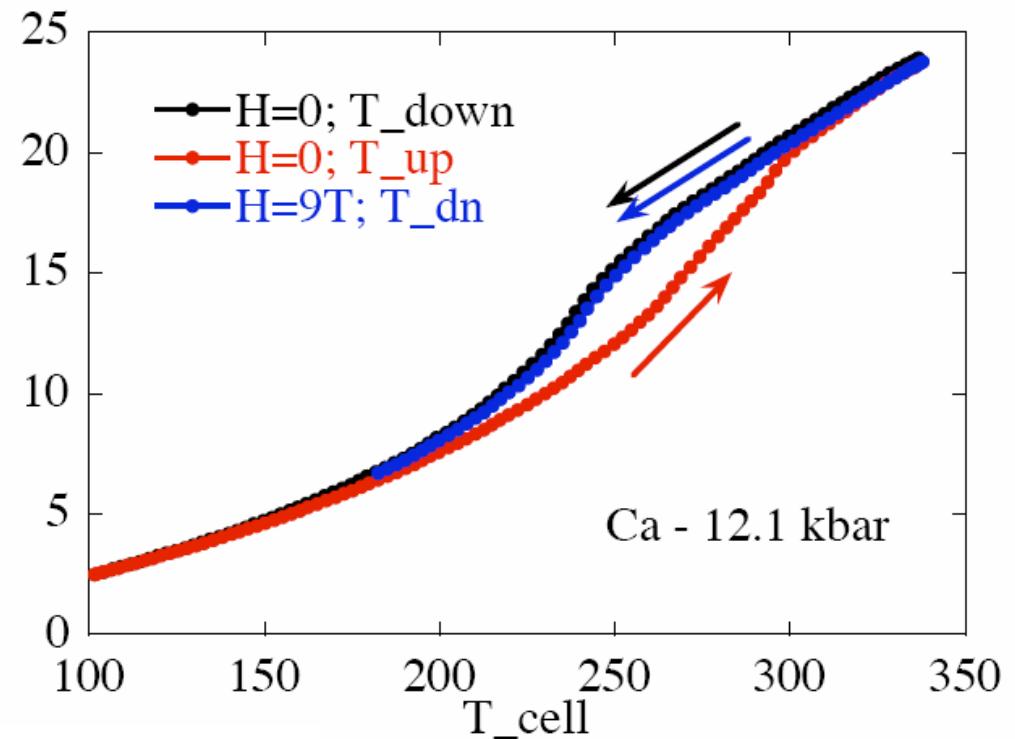

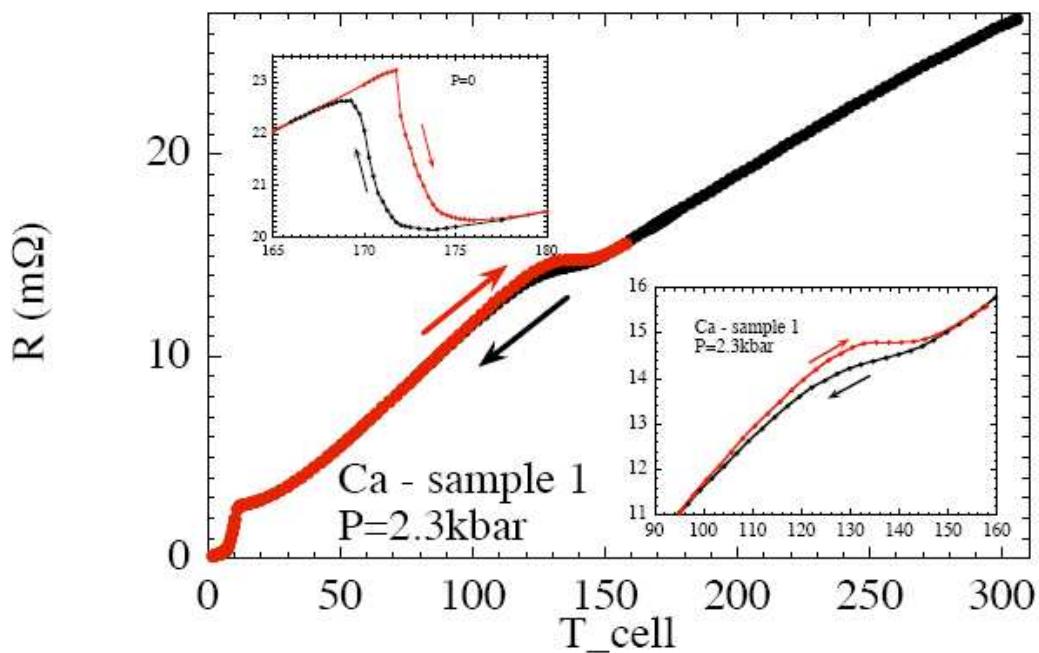

No doping

No disorder

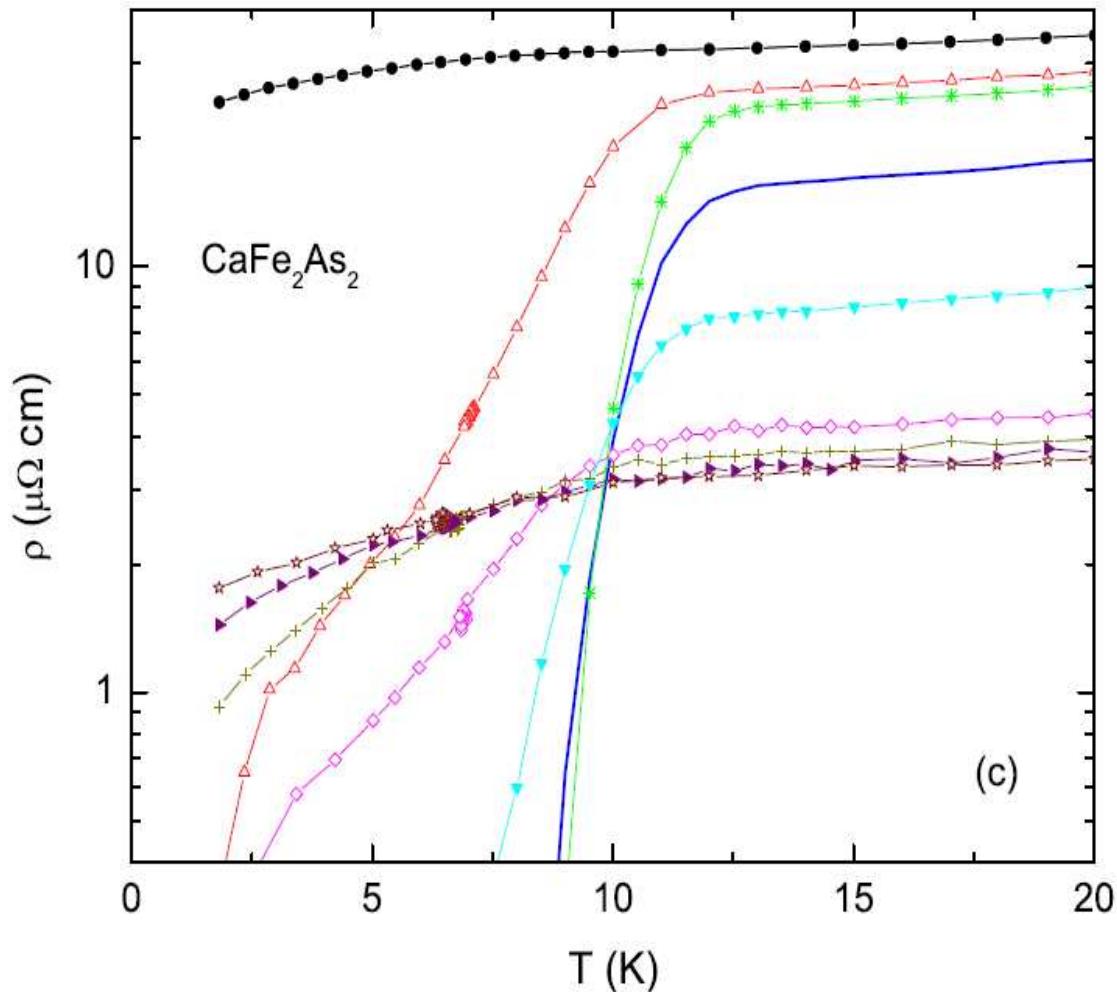

CaFe₂As₂ under pressure

Both of these high temperature transitions are first order in nature (as assessed via hysteresis in transport data).

Pressure Induced Superconductivity in CaFe_2As_2 

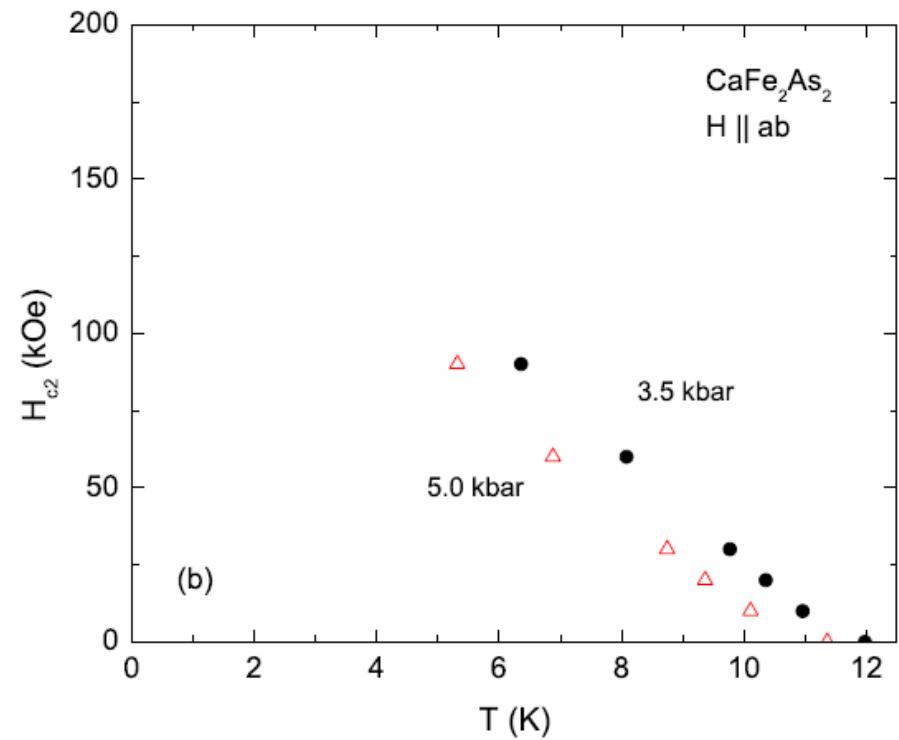

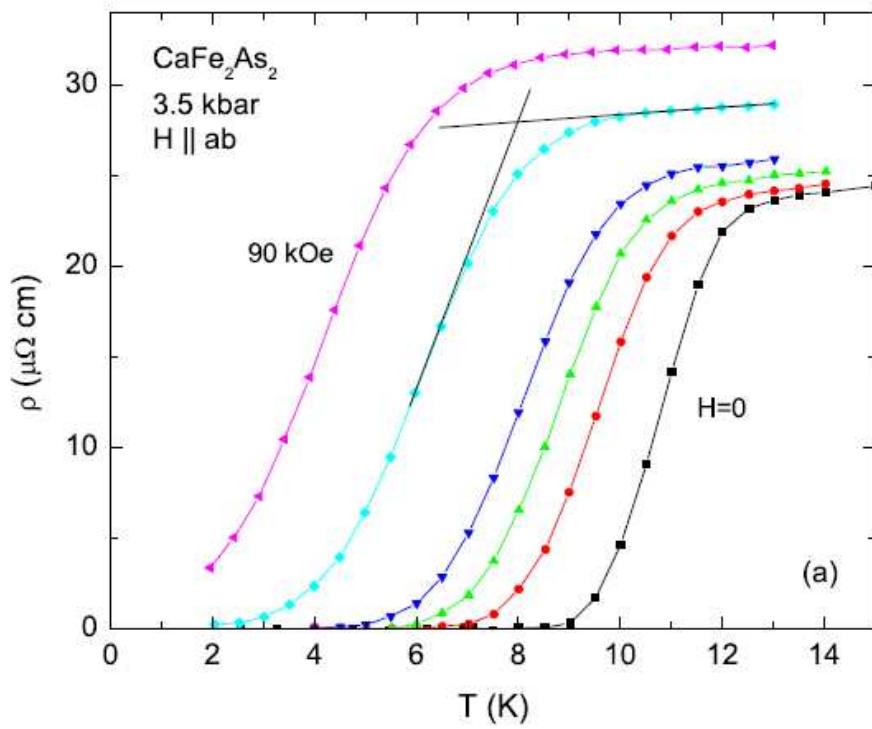

For low and high pressures there is no detectable superconductivity

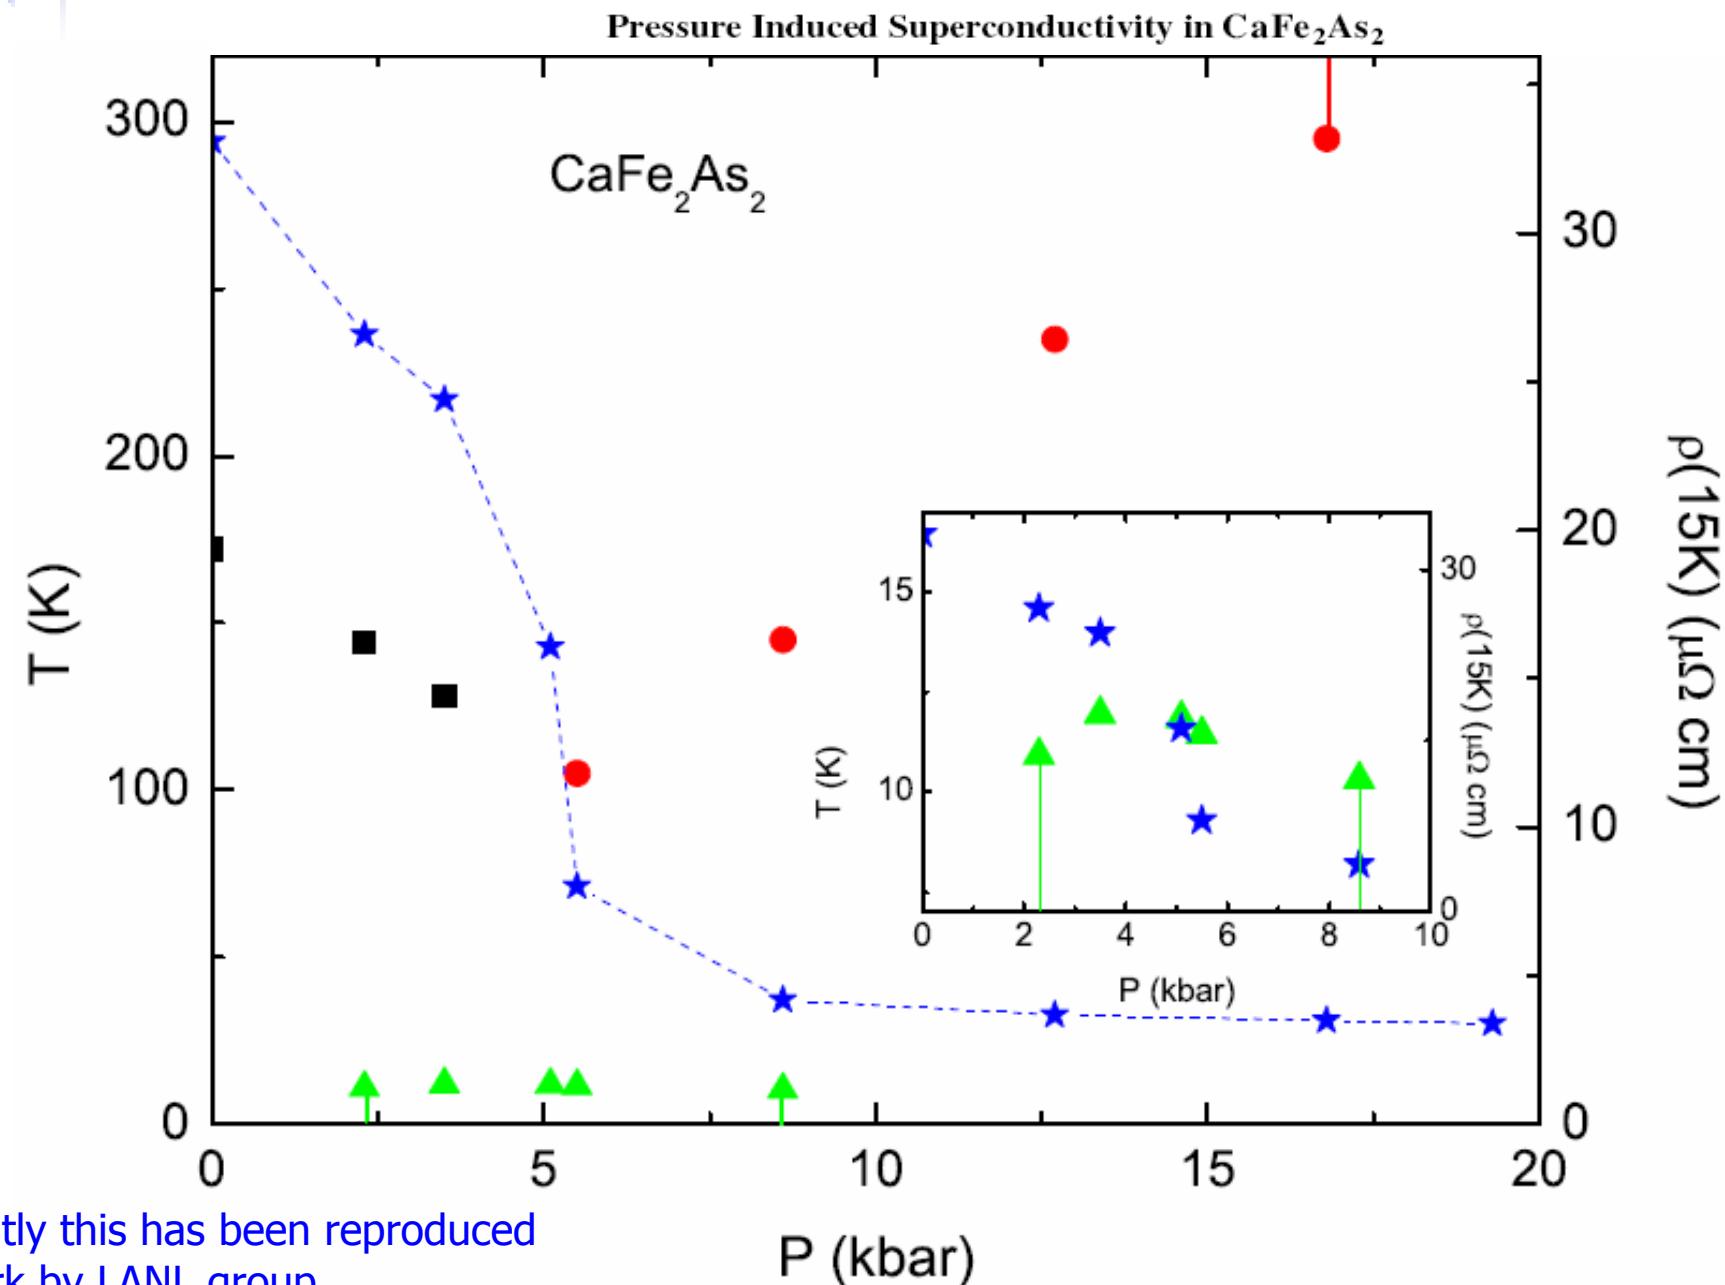

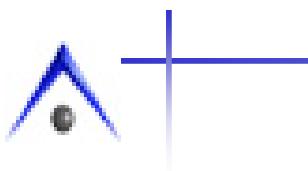

For pressures centered about 5 kbar there are sharp SC transitions

There is a dramatic reduction of residual resistivity, $\rho(15\text{K})$, as pressure passes through the 5 kbar region.

Pressure Induced Superconductivity in CaFe_2As_2

Reasonable H_{c2} curves for SC region.

Recently this has been reproduced
in work by LANL group.

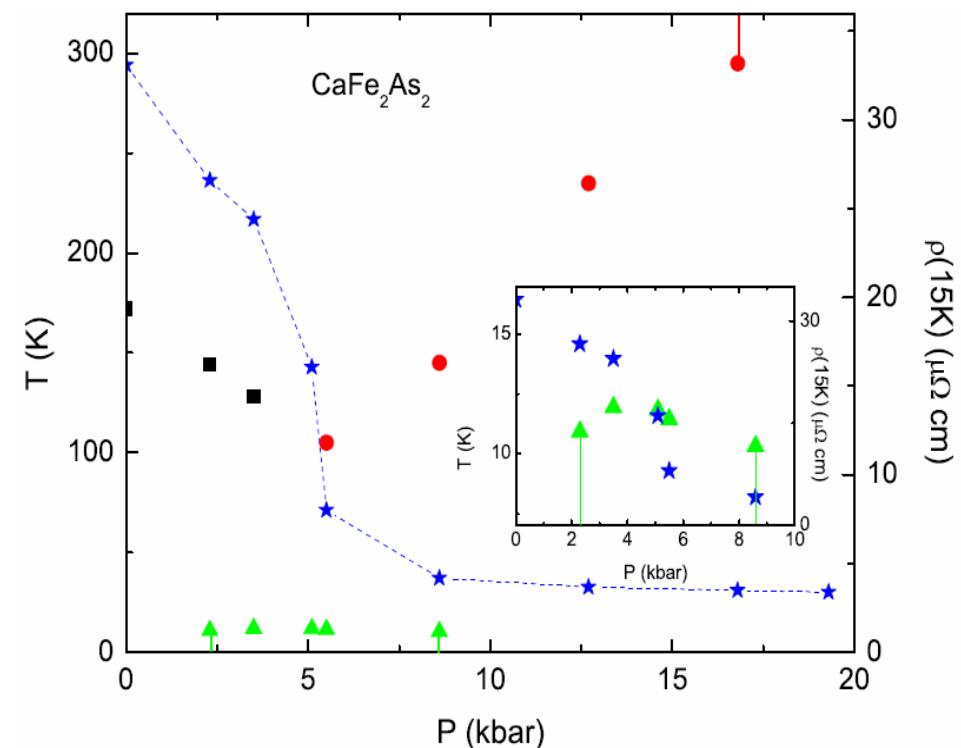

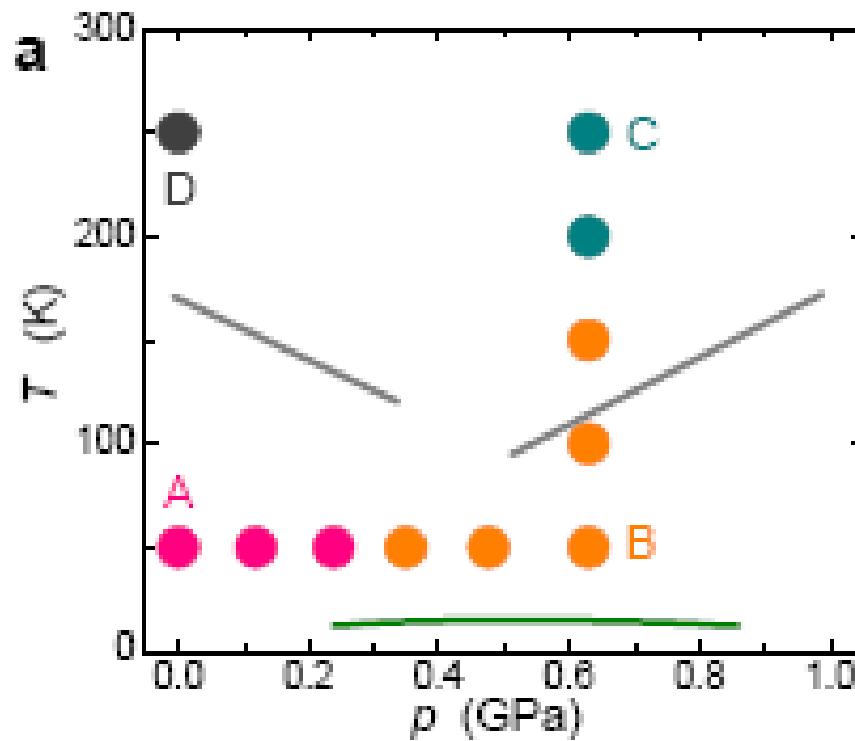

The P-T phase diagram of CaFe_2As_2 can be studied further via neutron diffraction work using He-pressure cells

For SrFe_2As_2 under pressure there is some question about nature or range of superconductivity

For both BaFe_2As_2 and SrFe_2As_2 the quality of the hydrostatic pressure may result in problems....

Similar phase diagrams have been mapped out for F-doped SmFeAs(O/F) , for Co-doped BaFe_2As_2 and for pure CaFe_2As_2 under very accessible pressures. T_c emerges as the structural / antiferromagnetic transition is suppressed.

Common features and hints from the data so far

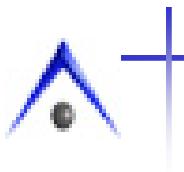

Several classes of FeAs compounds with square planar Fe capped top and bottom with As and with Fe^{2+} via gross / formal counting.

In cases of RFeAsO and AFe_2As_2 a (combined) structural and magnetic phase transition needs to be suppressed for SC to emerge. This transition seems to disappear quite suddenly.

Single crystals of the AFe_2As_2 compounds are VERY soft. The CaFe_2As_2 can be rolled into a spiral with fine tweezers. Not at all hard.

All of the salient features associated with these compounds can be found in pure CaFe_2As_2 under pressure. This may allow for a clean sorting out of what is going on.

More FeAs compounds are being found and more ways of “doping” them are being developed.

Current “Big” questions:

Operational / empirical questions

Is Fe special or can this be generalized to 3d transition metals?

Is $T_c < 60$ K the maximum T_c for this class of superconductors or is there a quantum leap to 100 K lurking near by?

Physical questions

What is symmetry of gap? Can it be different in 1111 and 122 compounds?

What is mechanism for pairing: what is important, proximity to AF transition, proximity to structural transition, both, neither?

Engineering questions

Can good PIT wires be made easily?

How high can J_c be pushed?

With $H-T_c$'s, RT_2B_2C , MgB_2 , and now $FeAs$ materials we are seeing that compounds that live between traditional oxide physics and intermetallic physics are the ones that offer exciting and potentially useful superconductivity.

With $H-T_c$'s, RT_2B_2C , MgB_2 , and now $FeAs$ materials we are seeing that compounds that live between traditional oxide physics and intermetallic physics are the ones that offer exciting and potentially useful superconductivity. Compounds with these elements have been avoided due to the difficulty in making them. These are precisely the compounds that will show properties that bridge between oxide and intermetallic physics.
