

GUARDIANS OF THE PAST

The Chrysler Building, New York City

 Recently received LEED Gold and Energy Star certifications for the Chrysler Building, the oldest skyscraper in New York City to have achieved both

GUARDIANS OF THE PAST

Rockefeller Center, New York City

- Installed a 21-tank, 80,000-ton ice chiller in Rockefeller Center that reduced the carbon footprint by approximately 400 tons
- Installed a 363-panel solar array that provides renewable sources of energy and allows generated power to be returned to the municipal grid
- In the process of installing a co-generation plant to further reduce energy demand by 2MW

PIONEERS OF THE FUTURE – FIRST ACHIEVEMENTS

- Achieved first LEED Gold for New Construction in New York at the Hearst Tower, and later helped achieve LEED-EB Platinum
- Tishman Speyer owns the only triple-certified (LEED, BREEAM and HQE) property in the world: Tour Esplanade in Paris
- Achieved first LEED Gold for Existing Buildings in New York at 375 Hudson Street

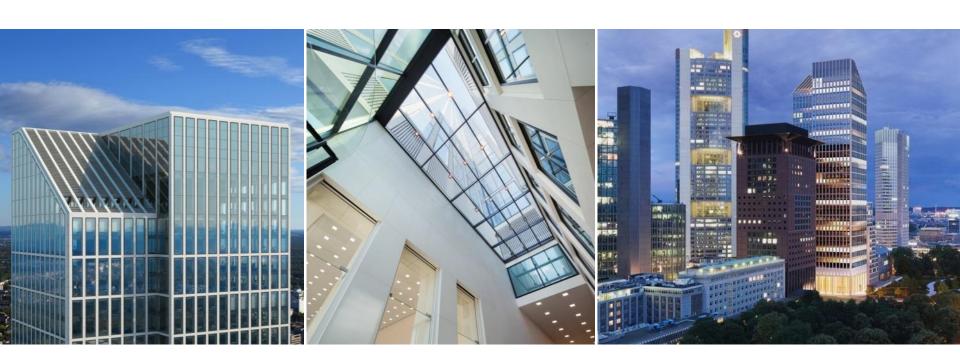

PIONEERS OF THE FUTURE - FIRST ACHIEVEMENTS

TaunusTurm, Frankfurt

- · Recently completed new development setting the global standard
- Currently pending LEED Platinum certification will represent the first building certified at this level in Frankfurt
- 35% estimated energy savings compared to buildings of similar size
- 90% of construction waste diverted from landfills
- 100% LED lighting throughout, resulting in annual reduction in energy costs of approximately 20%
- · Efficiently insulated building lowers the need for heating in winter and cost of cooling in summer

PIONEERS OF THE FUTURE – EMERGING MARKETS

- Currently developing a new 836,000 sqm mixed-use campus in Shanghai, to be certified LEED Gold for New Construction —
 The Springs
- First LEED Gold for New Construction in South America Rochaverá Corporate Towers
- Completed a 232,000 sqm office park in Hyderabad, certified LEED Gold for New Construction in India WaveRock

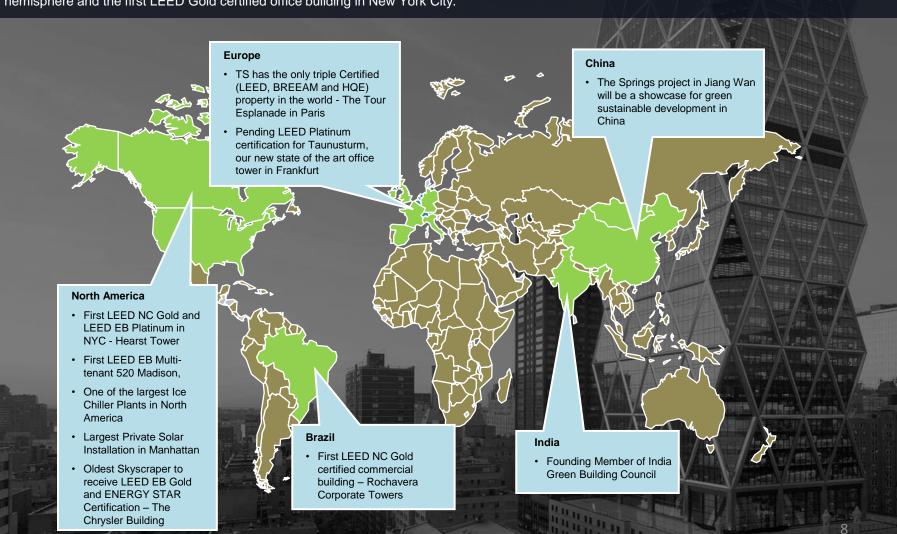

Our Commitment to Sustainability

TISHMAN SPEYER

We continue to be a global leader in sustainability with over 52 million square feet of LEED certified space, 7 Green Star funds for 2014 GRESB survey, a 2014 ENERGY STAR Partner of the Year Award and the first LEED Gold certified commercial buildings in the southern hemisphere and the first LEED Gold certified office building in New York City.

OUR GLOBAL IMPACT

These include assets in Brazil, the United States, Europe and India. Certification schemes are also under construction in China.

IDENTIFICATION OF CONSULTANTS

Leverage relationships with some of the world's best design and engineering firms while maintaining competitive fee structures.

INITIAL CONCEPT DESIGN

Evaluate design concepts with regard to constructability and budget constraints, and closely manage the architect so that feasibility is built in from the very beginning.

DESIGN PHASE PREPARATION

Now the Local Codes and Market Trends. Supervise all planning and approvals and site investigations required for the preparation of construction.

MANAGE THE PROCESS

Manage the entire design process from schematic to completed construction documents.

PLAN REVIEW, VE AND BUDGETING

Analyze all systems and components with an eye on the current construction market for labor and materials.

PROCUREMENT

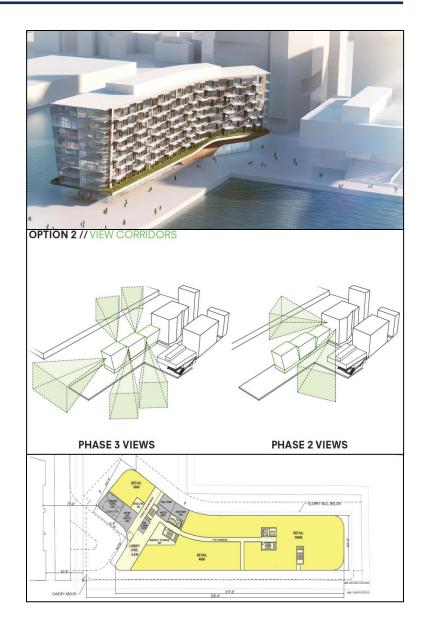

Stay involved in the selection of materials and equipment.

SCHEDULES AND RESOURCES

From approvals to bidding and through to construction, maintain momentum to stay on time and on budget.

COMMISSIONING AND DELIVERABLES

Follow through in the process of validating operational performance and the proper training of facility management personnel.

Baseline Design Criteria

The Baseline Design Criteria is NOT a cookbook or a limit on the Engineer's creativity.

It is simply an attempt to define critical issues of technical systems design that are important to Tishman Speyer Properties' ability to deliver high quality, yet flexible and cost efficient, mechanical and electrical systems for our properties.

It is imperative to keep in mind that technical system design solutions differ from market to market, country to country, and Engineer to Engineer. What is appropriate for New York may not be appropriate for Los Angeles and may be looked upon with horrified eyes by a European Consultant.

These Standards, while a worthwhile tool as a checklist or punch list as to what to cover with the Engineer/Consultant, is intended primarily for the use of the MEP Project Manager/Engineer who is best qualified to control the MEP design and construction process and make the necessary judgments as to when to deviate from these Standards and Criteria.

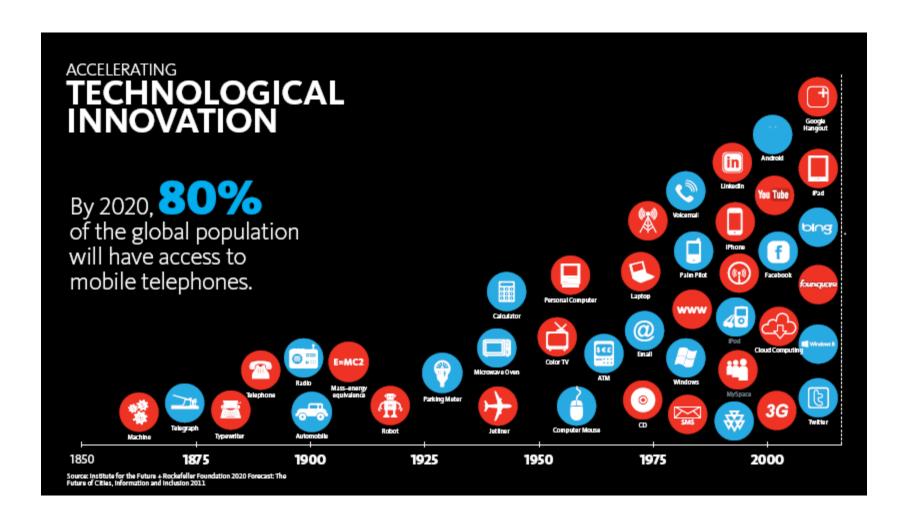

The MEP Project Manager/Engineer needs to keep in mind "best practice" in the use of these "criteria" in guiding the Engineer/Consultant through the design process.

LOOK INTO THE FUTURE

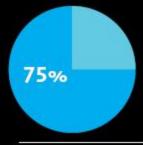

Provide a flexible and agile workspace catering for the following:

- -Informal reception/meeting space for 3 seats
- -Large Meeting Room for 12 pp
- -Small Meeting/Focus room for 6pp
- -Breakout/Kitchen area for 14
- -One small office or quiet meeting room for 4pp
- -4 different types of work points consisting of:
- -6 electrically height adjustable desks that can be unplugged and moved around the tenancy
- -4 focus / private or quiet work points
- -8 open plan workstations that allow for collaborative working

THE RISE OF THE FREE AGENT

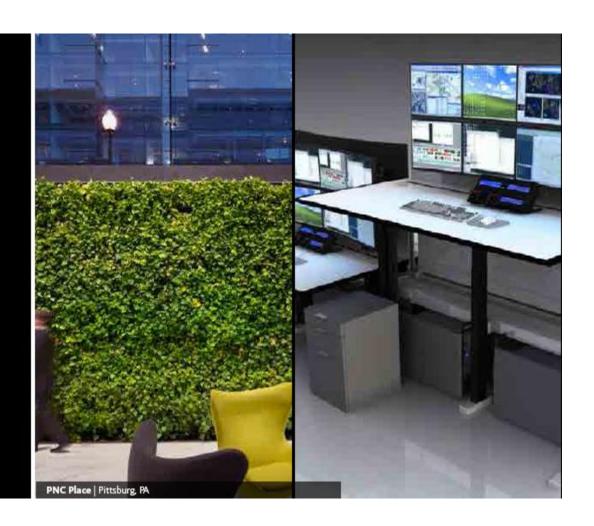

War for talent driving workplace innovation.

"Fewer Harvard MBA's going to work on Wall Street" - The Washington Post, September 2013

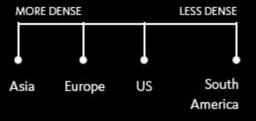

THE PUSH FOR HEALTH & WELLNESS

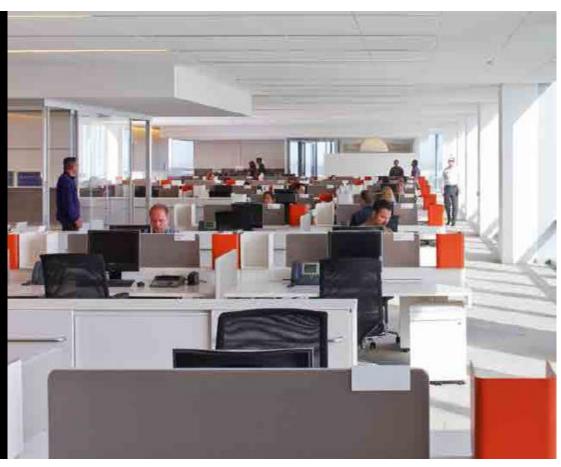

To meet employee demand and ensure retention, global firms are infusing fitness spaces, health programs and living art displays into their workplace designs.

ADOPTING GLOBAL MODELS

Now, more than ever, companies are adopting global standards across their entire portfolio.

VISIBILITY & TRANSPARENCY

Exhibit transparency and openness in design, while acknowledging compliance requirements.

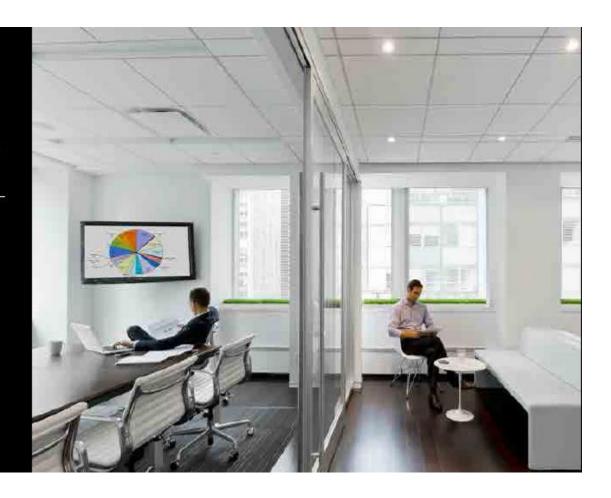

ONSITE & OFFSITE MOBILITY

50%

of firms surveyed have already developed an unassigned seating/mobility program.

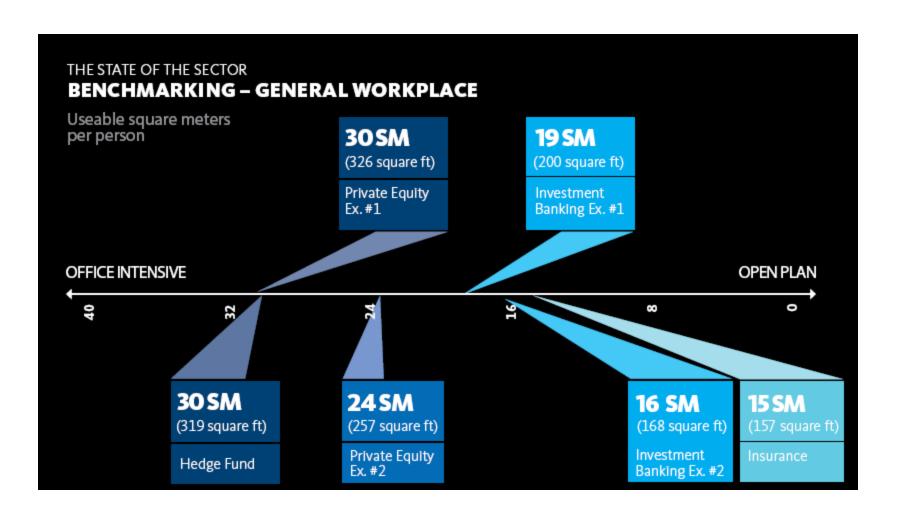

This study looked at companies such as: Morgan Stanley, HSBC, Deutsche, JPMC, Credit Suisse, UBS, Wells Fargo, Bank of America, TDBank, Goldman Sachs, PNC, and Capital One

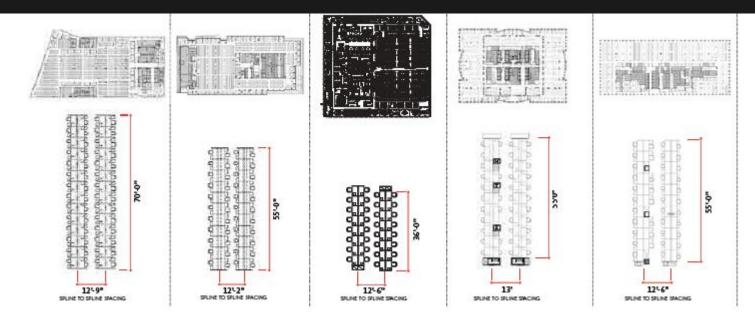

EMPLOYEE ATTRACTION AND RETENTION

Currently only one in four financial services employees works in a top-performing workplace.

ASHRAE 90.1-2007 Appendix G

3.1 General Description

ASHRAE Standard 90.1-2007 provides minimum energy-efficiency requirements for the design and construction of new buildings and their systems, building additions and their systems, new systems, and equipment in existing buildings.

The Appendix G of the ASHRAE 90.1-2007 standard uses the Performance Rating Method to evaluate the energy performance of building designs. All energy costs within and associated with the building project have to be considered. Additionally, the design has to meet all the requirements of ASHRAE 90.1-2007 as described in sections 5.4, 6.4, 7.4, 8.4, 9.4 and 10.4, as well as all mandatory provisions.

Appendix G sets the modeling requirements for calculating the design and the baseline building performances. These requirements apply to:

- Building Envelope
- Additions and Alterations
- Space Use Classifications
- Schedules
- Lighting
- Thermal Blocks HVAC Zones
- HVAC Systems
- Service Hot Water Systems
- Receptacle and other Loads
- Modeling Limitations to the Simulation Program

In this approach the proposed design is compared against a baseline case as outlined by ASHRAE Standard 90.1-2007 in terms of energy cost savings. This percentage determines the number of points achievable under LEED rating system for EA Credit 1.

VI. Model Input Summary: ASHRAE 90.1 2007 Baseline and Base ECM's

| | PIER-IV Development : DD Model Input Sumi | mary |
|----------------------------------|---|--|
| | Exterior Envelope | |

IDENTIFICATION OF CONSULTANTS

Leverage relationships with some of the world's best design and engineering firms while maintaining competitive fee structures.

INITIAL CONCEPT DESIGN

Evaluate design concepts with regard to constructability and budget constraints, and closely manage the architect so that feasibility is built in from the very beginning.

DESIGN PHASE PREPARATION

Now the Local Codes and Market Trends. Supervise all planning and approvals and site investigations required for the preparation of construction.

MANAGE THE PROCESS

Manage the entire design process from schematic to completed construction documents.

PLAN REVIEW, VE AND BUDGETING

Analyze all systems and components with an eye on the current construction market for labor and materials.

PROCUREMENT

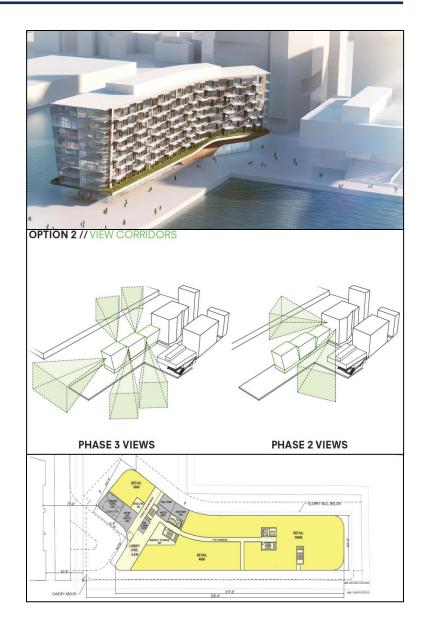

Stay involved in the selection of materials and equipment.

SCHEDULES AND RESOURCES

From approvals to bidding and through to construction, maintain momentum to stay on time and on budget.

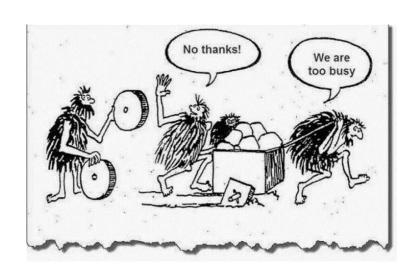

COMMISSIONING AND DELIVERABLES

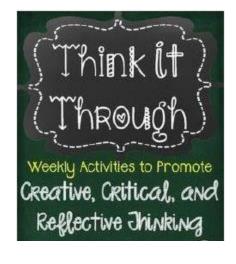

Follow through in the process of validating operational performance and the proper training of facility management personnel.

ENGAGE EARLY

Procurement Methods for pre-purchase or direct purchase items, items which Citi wishes to have quality control over and items of a large quantity to limit parts and service issues resulting from multiple suppliers:

Method 1. Specifications name multiple manufacturers. Contractors may choose any one they wish to use. The manufacturer is not known until the submittal stage. Any deviation from the listed names, require they follow procedures for substitutions.

Fans

Amenities AHU

Pumps

Heat Exchangers

Valves

BOH light fixtures

Motors

Electrical Panels

Transformers (General)

Load Bank

Unit Heaters

UFAD Supply Fan upgrades

Window Washing

Registers, Diffusers and Linear Grills

Grass Seed

Method 2*. Tishman or Turner issues an RFP for an equipment package. Once a Vendor is selected, the package is assigned in total to one or more specific installing contractors.

Chillers

DOAS Boxes for Corp Center

CRAH Units (Turner)

UFAD / Air Columns (Turner)

Generators

Utility and Distribution Switchboards, Panel Boards and Transformers¹

UPS² / CDPs¹

RPP / PDUs² (Turner)

Paralleling Switchgear¹ / ATS Switches

Electrical Power Monitoring System (EPMS)

- 1 Breakers to be broken out with alternate prices for Citi to select manufacturer
- 2 Alternate manufacturers to be broken out for Citi to select manufacturer

Method 3*. Tishman or Turner issues an RFP for a labor and material package. Citi interviews the bidders and selects one. Tishman or Turner issues them a contract for labor, material and service contract. Tishman will establish unit prices that Turner will use.

Elevators

BMS

Fire Alarm

First Responder – Design-Build (HP writes performance specs)

Method 4*. Tishman or Turner issues an RFP for unit prices. Once a vendor is selected, contractors deal directly with the vendor or their representative to procure the item.

Lighting Control

Lighting Fixtures

DOAS Boxes for Typical Floors

VFD

Ceiling System (Turner)

Access Flooring (Turner)

Window Treatment (Turner)

Method 5. Tishman or Turner issues an RFP for a bid package for material and labor. The contractors are given multiple manufacturers to choose from on a specific item. The contractor names which manufacturer he has based his bid on. The contractor has to state the price difference for alternate manufacturers. Citi will interview the vendors and/or select a preferred supplier.

Ice Storage

Boilers

Method 6. Once an award is made to a contractor, that contractor receives bids from multiple manufacturers and presents the cost differences. Citi selects the manufacturer. The contractors purchase the items which are part of their scope. From the manufacturer, prices are guaranteed to other contractors purchasing identical items at the established unit prices.

Typical Floor 100% OA Units

VAV Boxes

Fan Powered Boxes

Power and Data outlets in Raised Floor

Toilet Faucets

Sinks

Water closets

Urinals

Flushometers

Bathroom Partitions

Toilet Accessories

Fire Extinguisher Cabinets

Pantry Refrigerators

Pantry Water and Ice Dispensers

Pantry Microwaves

Drinking Fountains

Door Hardware and Locksets

Method 7. Tishman or Turner instructs in their Riders that the bidding installers contact Citi approved distributors who will furnish the material at pre-negotiated contract prices with Citi. The BOM will be as per the plans and spec and no substitutions will be accepted.

CAT 6 and CAT 6A Structured Cabling
IT Racks and Cable Management Hardware
IT Rack PDUs/Power Strips
IT Grounding Products
BMS Fiber Riser

Method 8. Tishman and Turner will issue a pre-approved list of sub-contractors. Contractors will qualify in their BAFO which contractor they will use.

T&B Contractor (no list of approved sub-contractors) Vibration Analysis

Method 9. Citi directly selects a manufacturer or supplier and Tishman or Turner issues a contract to that vendor as well as assigning labor to an installing contractor.

Method 10. Citi directly selects a manufacturer and Tishman or Turner instructs in their Riders that only that manufacturer is acceptable.

Siemens Onicon insertion electromagnetic meter (in 390 Chiller

Plant)

Carpet

Method 11. Citi will select a vendor and directly issue a purchase order for material and labor. Tishman and Turner will coordinate with that vendor.

Office Furniture
Ancillary Furniture
Office Fronts

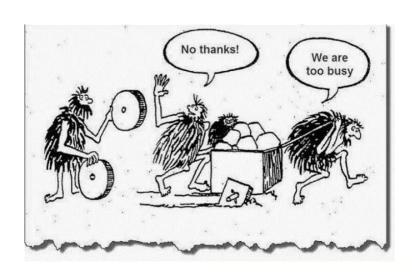

Method 12. Citi will select a vendor and directly issue a purchase order. Tishman and/or Turner will include the wiring plus antennae in a bid package.

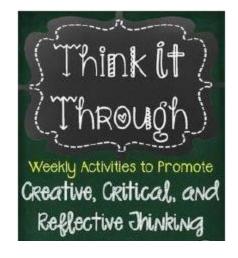

DAS Integrator Security Integrator

^{*}Require bid packages from SOM or Gensler

ENGAGE EARLY

LOOK FOR THE LITTLE THINGS (THEY ADD UP)

- ECM Variable speed
- Balance with VFDs
- Fan Wall Discharge Dampers
- Maximize BMS
- Optimization is a Standard
- What is a Smart Building?
- Go to Benchmarking and Trust your Instincts
- What is 6 watts per square foot?
- Rentable or Usable (80%)
- Understand Resiliency N+1
- Pump Through
- Thermal Storage
- Detention vs Retention

When compared to similarly sized PSC motors, constant torque motors reduce power consumption, using approximately 413 watts in cooling mode and only 200 watts in continuous fan mode - compared to 552 watts and 515 watts, respectively, for PSC models.

ECM motor technology provides the ability to program and deliver constant airflow over a wide range of ESP, typically up to 1.0 inches water column.

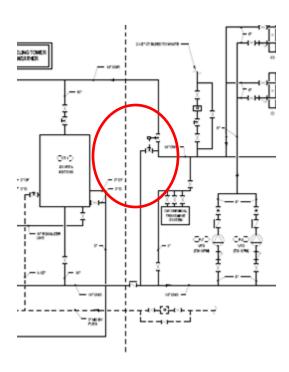

This feature automatically compensates for any added pressure drop introduced to the system. For example, if a duct system layout has an increased static pressure due to a dirty filter, the presence of a media filter or simply because of poor design, the motor will automatically ramp up to ensure that the programmed amount of airflow is delivered. This is accomplished without the use of any additional components.

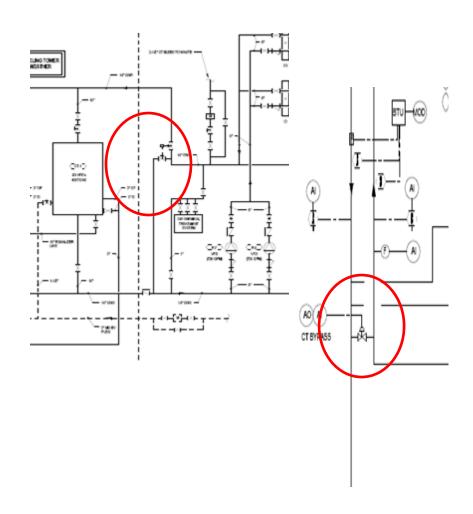

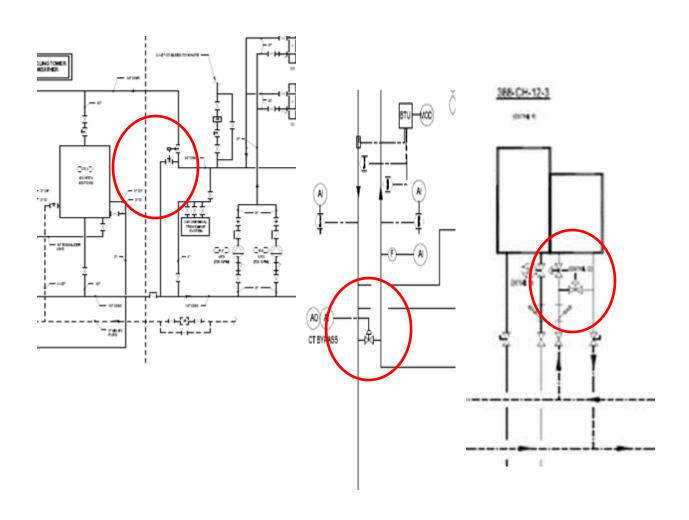

Tower Bypass with 3-way valve, constant speed CW pumps

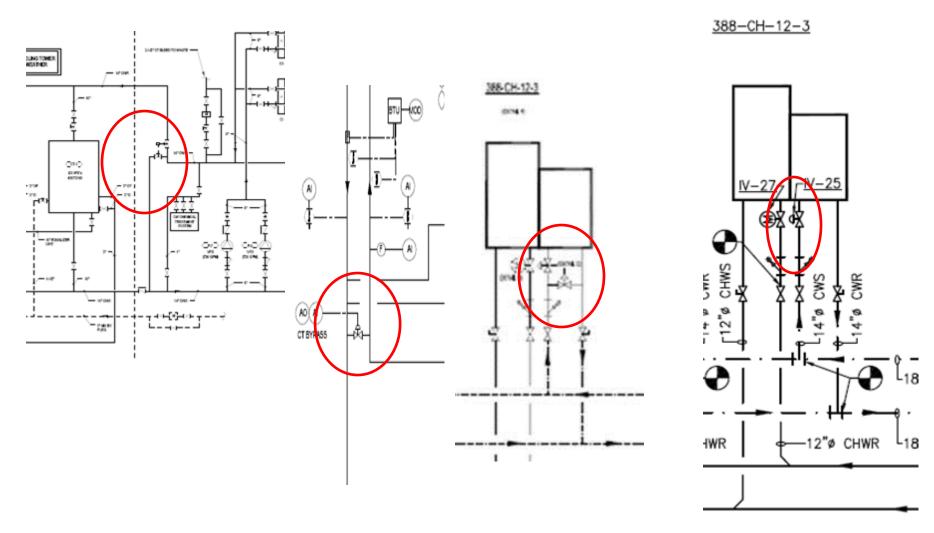

Tower Bypass with 2-way valve, constant speed CW pumps

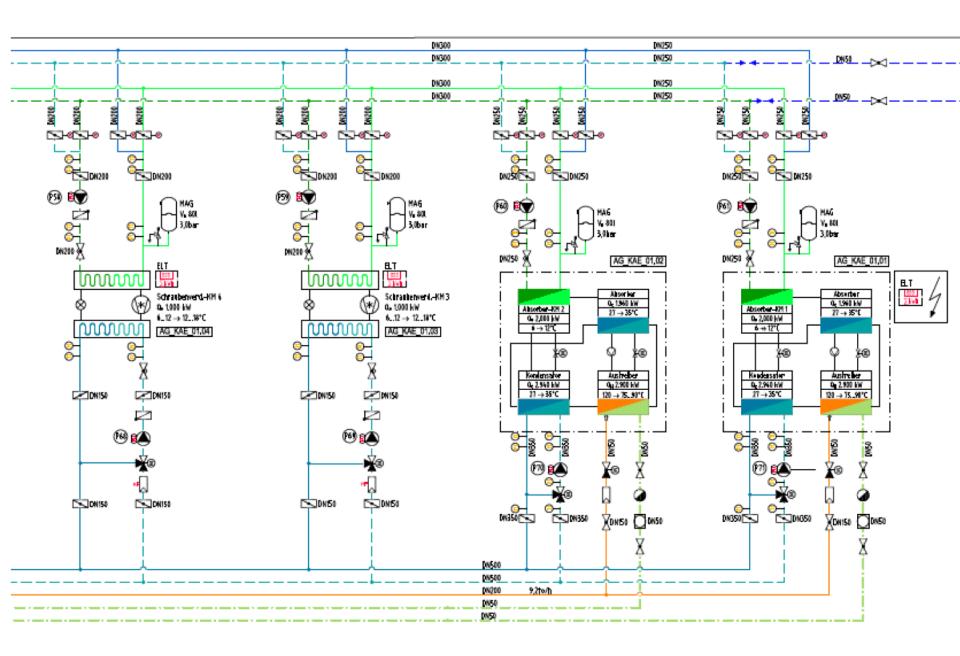

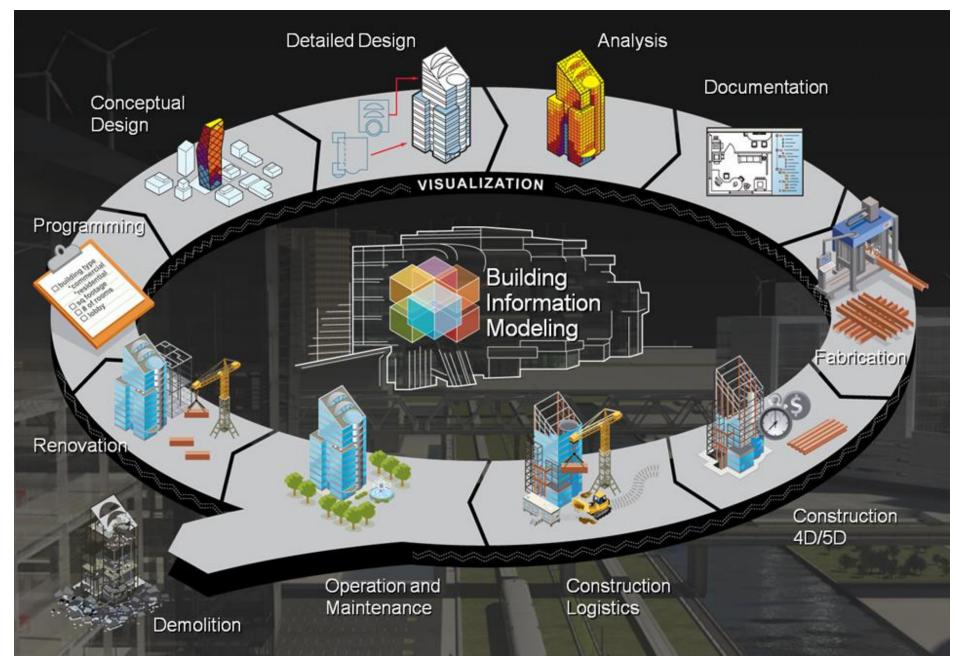

Bypass at Chiller, VFD on CW pumps

Two-way modulation at Condenser, VFDs on CW pumps
