Information Management: A Proposal

Abstract

This proposal concerns the management of general information about accelerators and experiments at CERN. It discusses the problems of loss of information about complex evolving systems and derives a solution based on a distributed hypertext system.

Keywords: Hypertext, Computer conferencing, Document retrieval, Information management, Project control

**Come writers and critics who prophesize with your pen
And keep your eyes wide, the chance won't come again
And don't speak too soon for the wheels still in spin
And there's no tellin' who that its namin',
For the loser now will be later to win
For the times they are a-changin'.**

Bob Dylan, 1964

TWEETS FROM TAHRIR

EGYPT'S REVOLUTION AS IT UNFOLDED, IN THE WORDS OF THE PEOPLE WHO MADE IT

Edited by **NADIA IDLE** and **ALEX NUNNS**

Foreword by **AHDAF SOUEIF**

#JAN25

@Gsquare86 Gigi Ibrahim

Everyone in Cairo who wants Mubarak out and stands for justice come to Tahrir NOW!
Feb 2

"Without the new media the Egyptian Revolution could not have happened in the way that it did. The causes of the revolution were many; deep-rooted and long seated. The turning moment had come – but it was the instant and wide-spread nature of the new media that made it possible to recognise the moment and to push it into such an effective manifestation."—Ahdaf Soueif, from the foreword

ABOUT THE BOOK

The Twitter accounts of the activists who brought heady days of revolution to Egypt in January and February this year paint an exhilarating picture of an uprising in real-time. Thousands of young people documented on cell phones every stage of their revolution, as it happened. This book brings together a selection of key tweets in a compelling, fast-paced narrative, allowing the story of the uprising to be told directly by the people in Cairo's Tahrir Square.

Your favourite academic tweeters: lists available to browse by subject area

Blog Admin

In the run up to launching a Guide to Academic Tweeting, we asked you to recommend your favourite academics on Twitter. Over the last week we received over 500 suggestions across all the major subject areas, and discovered some great new Tweeting gems with your help. Here we present all the suggestions, broken down into five subject area lists. Please feel free to share with anybody new to Twitter, and have a browse to see if you can find your new favourite academic tweeter.

Thank you to everybody who suggested their favourite academics on Twitter following the [invitation on the blog](#) last week. The responses we received were very positive and we were rather overwhelmed, but ultimately excited that a useful resource was being created by so many people.

In an attempt to turn the list into useful resources, we have separated the users into five subject areas, based on their research areas. Academics, researchers and experts in their fields have all been suggested, but let us know if you'd like to suggest somebody new.

See the [Social Sciences list on Twitter](#)

The Social Sciences list features researchers and academics who work in anthropology, economics, geography, law, political science, and sociology. It is the longest list, with over 150 suggestions.

See the [Arts and Humanities list on Twitter](#)

As the second largest list, the Arts and Humanities contributions cover academics and researchers who are interested in history, languages, literature, philosophy, and music.

See the [Science, Technology, Engineering and Mathematics list on Twitter](#)

The suggestions for STEM subject academics revealed some very prolific Tweeters, although we are a little short on the Mathematics front. If you have any more suggestions that you'd like to see on the list

Day and Time of Session:	Tuesday, October 5; 02:30 PM - 04:00 PM
Title:	To Tweet or Become Extinct?: Why Surgeons Need to Understand Social Networking
Description:	The use of social networking sites, such MySpace, Face book, Twitter, YouTube and other as a means of communication is exploding, particularly among millions of young people. Social networking sites have been increasingly adopted by many online health-related professional and educational services. Social networking may represent an effective way for surgeons to better serve, i.e., to communicate, to educate, to care, for their patients, the public, medical students, residents and the general public. In this session, we will inform surgeons about how surgeons can use social networking and the potential uses and abuses of social networking sites. You can follow this panel discussion now (premeeting) and live (during the panel) on Twitter @ "#ACS2010".

Using Twitter for training

A lot of the training consists of passing on information, lessons learned and wisdom to the next generation. Twitter allows us to dramatically scale up our ability to do this. When I post something on Twitter, all the pediatric surgeons, trainees and colleagues in the country and the world can see it instantly.

Peer-review me:

A Perceived benefits from web-based educational migraine websites

bit.ly

Background: Web-based resources are frequently used by patients for medical information. Low confidence in ability to manage migraines (self-efficacy) has been linked to increased disability and web-based interventions have been shown to improve patient self-efficacy. **Objective:** To evaluate self-efficacy among migraineurs visiting a migraine-specific website and the impact of self-efficacy on utilization of web-based resources. **Methods:** This open survey collected data on utilization and impact from a migraine-specific educational and community website, Migraine.com, launched December 2010. Self-reported migraineurs visiting the website at least 3 times were surveyed about their experience. Participants were asked about demographics, migraine frequency, self-efficacy, and utilization of various website features. **Results:** During the month of data collection, 524 individuals participated in the survey (94.1% female, with over half of the sample between ages 35 and 54 years old). Overall...

jmir.org:

A Comparison of a Postal Survey and Mixed-Mode Survey Using a Questionnaire on Patients' Experiences With Breast Care

bit.ly

Background: The Internet is increasingly considered to be an efficient medium for assessing the quality of health care seen from the patients' perspective. Potential benefits of Internet surveys such as time efficiency, reduced effort, and lower costs should be balanced against potential weaknesses such as low response rates and accessibility for only a subset of potential participants. Combining an Internet questionnaire with a traditional paper follow-up questionnaire (mixed-mode survey) can possibly compensate for these weaknesses and provide an alternative to a postal survey. **Objective:** To examine whether there are differences between a mixed-mode survey and a postal survey in terms of respondent characteristics, response rate and time, quality of data, costs, and global ratings of health care or health care providers (general practitioner, hospital care in the diagnostic phase, surgeon, nurses,

NIH Refers to 'Wikipedians' for Help: Scientists Learn Online Etiquette

By [Ibby Caputo](#)
Washington Post Staff Writer
Tuesday, July 28, 2009

What is acetaminophen made from? Does heartburn lead to Barrett's esophagus? Will your 3-year-old outgrow her stutter?

When Americans have questions like those, one of the first places they go for answers is online. At some point, many end up at Wikipedia.

"More and more people are using the Web to get their health information to augment what they learn from their physicians," says John T. Burklow, the public liaison for the National Institutes of Health. A recent survey by the Pew Internet & American Life Project shows that researching health information is the third most popular online activity among adults, after e-mail and general searching.

To make that online information more reliable, NIH is encouraging its scientists and science writers to edit and even initiate Wikipedia articles in their fields. This month, it joined with the Wikimedia Foundation, which publishes the cyber encyclopedia, to host "Wikipedia Academy," a training session on the

language Wikipedia articles at least five times a month - gave presentations promoting the open-source encyclopedia and encouraging about 100 NIH employees to become editors. The volunteer instructors, or "Wikipedians," were not just techno-geeks; they also included scientists who could appreciate the questions NIH staffers might have. Attendees were shown how to use the template that produces a Wikipedia article, with its embedded table of contents and multiple links; they also discussed topics such as managing the quality of articles and the verifiability of information.

Among those at the event was Ronald Summers, a radiologist at the NIH Clinical Center who is trying to find ways to spot early colorectal cancer. He said he had thought about contributing to Wikipedia before but had been intimidated by its complexity.

"It seemed like they had a special language you had to use to format the articles," Summers said.

monitored by fellow users, who can make corrections and change the text freely. All information that is posted is supposed to include citations so a reader can check the primary sources of the data.

By law, NIH must make its health and science articles publicly available within a year after they appear in peer-reviewed journals. A collaboration with the Wikimedia Foundation seemed natural, Burklow said, because NIH and the foundation share a common goal "that the information on Wikipedia is of the highest quality and up-to-date."

Since the workshop, Summers has edited his first Wikipedia article, though he would not disclose the topic because editors are supposed to be anonymous.

"As it turned out, it was a very simple structure with headings and indentation levels," Summers said. "You could learn it

[RSC Open Notebook Science Awards - Apply Here](#)

What?

The first round of this challenge calls upon people with access to materials and equipment to measure the solubility of compounds (aldehydes, amines and carboxylic acids are a priority) in organic solvents and report their findings using [Open Notebook Science](#). (View the [cumulative list of results](#) or as a [web query interface](#) (courtesy of Rajarshi Guha) or in a [book format](#). Note: some of these values may be approximate - see respective notebook pages to ascertain assumptions and methods.)

Why?

Understanding exactly how an experiment was performed is essential to the efficient progress of science. There are no absolute facts in the scientific literature; every measurement reported is only meaningful within the full context of how it was generated. The purpose of a laboratory notebook is to report as much of this context as is reasonable. But to find trends data must be abstracted to a level where they can be manipulated in tables and charts. This is not a problem as long as one can drill down from each data point in a chart to the full context found in the laboratory notebook.

For example, a Google search for "vanillin solubility in THF" pulls up a lab book page [EXP207](#) where it is reported to be 3.89M. This number might be used in a table of someone trying to quantify trends or test a mathematical model, in which case reliability of the number is important. By reading the lab notebook page it becomes clear that 118.5 mg of solid was measured on a scale with 0.1 mg accuracy. However only one measurement was obtained. All kinds of other details which might be important are provided, for example how long the mixture was vortexed, at what temperature and the [physical appearance after evaporation](#). If this number turns out to be an outlier, one can investigate if a calculation error was the cause by inspecting the [linked spreadsheet](#).

However, if a researcher is simply looking for the feasibility of making up a 2M solution of vanillin in THF for a reaction the margin of acceptable error is so wide that the answer is almost certainly "yes".

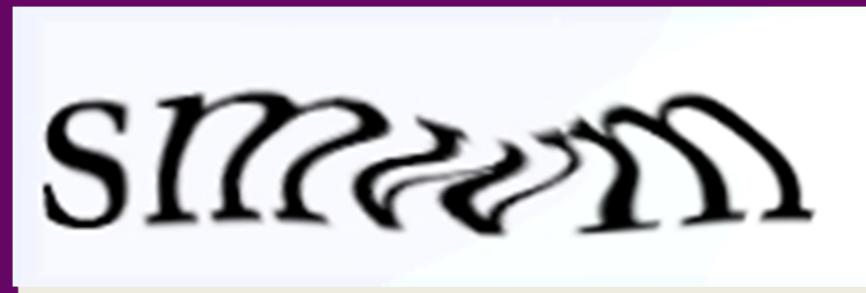

The purpose of Open Notebook Science is to allow immediate communication of scientific results. The value of these results will depend upon the quality of the laboratory notebook and the linked raw data. Publication in peer-reviewed journals is still an extremely important part of this process but it is not an appropriate vehicle for the efficient communication of this type of information.

In fact, one of the motivations for participating in this project is that we will collect data from sufficiently well recorded experiments and publish them in a peer-reviewed journal with the participation of the researchers as co-authors. We aim to build a mathematical model to predict solubility using the results obtained from this project. Solubility data from non-aqueous solvents is still quite sparse (for example see the [NIST solubility database](#)).

From a larger perspective, these experiments fit within a project to synthesize new anti-malarial agents using the [Ugi reaction](#). By being able to predict the solubility of starting materials and product, we [postulate](#) that we can predict an optimal solvent and concentration to carry out the reaction and isolate the Ugi product by simple filtration. For more on this approach see: Bradley, Jean-Claude, Mirza, Khalid, Owens, Kevin, Osborne, Tom, and Williams, Antony. [Optimization of the Ugi reaction using parallel synthesis and automated liquid handling](#). Available from *Nature Protocols*, <http://hdl.handle.net/10101/npre.2008.2237.1> (published in *Int J Vis Evol*, 2008 Nov 11/21, pii: 942, doi: 10.3791/042).

Gamers Unlock Protein Mystery That Baffled AIDS Researchers For Years

By Leslie Horn

September 19, 2011 10:42am EST

51 Comments

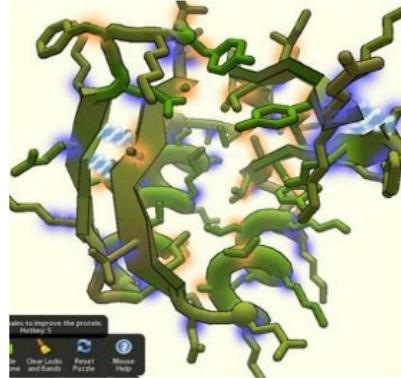

Email

Print

SU 15K

In just three weeks, gamers deciphered the structure of a key protein in the development of AIDS that has stumped scientists for years. According to a [study](#) published Sunday in the journal *Nature Structural & Molecular Biology*, the findings could present a significant breakthrough for AIDS and HIV research.

Using an online game called Foldit, players were able to predict the structure of a protein called retroviral protease, an enzyme that plays a critical role in the way HIV multiplies. Unlocking the build of the protein could theoretically aid scientists in developing drugs that would stop protease from spreading.

"Following the failure of a wide range of attempts to solve the crystal structure of M-PMV retroviral protease by molecular replacement, we challenged players of the protein folding game Foldit to produce accurate models of the protein," the study reads. "Remarkably, Foldit players were able to generate models of sufficient quality for successful molecular replacement and subsequent structure determination. The refined structure provides new insights for the design of antiretroviral drugs."

Developed by researchers at the University of Washington, Foldit turns scientific problems into competitive games. Players were charged with using spatial and critical thinking skills to build 3D models of protease. Few of these players had any kind of background in biochemistry.

According to [Fox](#), it took players a matter of days to come up with models that were solid enough for researchers to translate into scientific rendering of the protein.

"People have spatial reasoning skills, something computers are not yet good at," Foldit's lead designer Seth Cooper [said](#) in a statement. "Games provide a framework for bringing together the strengths of computers and humans."

Foldit has not only made this breakthrough with AIDS research, but it has also [aided](#) in Cancer and Alzheimer's research. For more, read the study in its entirety [here](#).

International Space Apps Challenge

an Open Government Partnership Initiative by openNASA

Join the International Space Apps Challenge!

open data + open source + open technology

In the 1960's the Apollo guidance computer that took humanity to the moon had a clock-speed of 2.048 megahertz, 4 kilobytes of memory, and weighed 32 kilograms (70 lbs). Since then, advances in technology have made images clearer, the information coming back from space richer, and the world smaller.

Today, many of us carry smartphones that have 512 megabytes of active memory, 32 gigabytes of storage, weigh less than 200 grams, and can form a real-time connection instantly to anywhere in the world. Our investments in space exploration have generated incredible amounts of data and resulted in the development of new technology that continues to improve life on Earth.

The challenge before us is to leverage data and new technology to create practical applications that benefit humanity.

Come make the future with us.

What is the International Space Apps Challenge?

Demonstrating its commitment to the Open Government Partnership, NASA will work with space agencies around the world to coordinate an International Space Apps Challenge to be held in 2012 that will encourage scientists and concerned citizens from all seven continents – and in space – to create, build, and invent new solutions in order to address challenges of global importance.

The International Space Apps Challenge is an innovative international collaboration that accelerates the development of solutions focused on making government better and addressing critical issues on our planet, including (but not limited to) weather impacts on the global economy and depletion of ocean resources. The unique challenges posed by

KICKSTARTER:

The Science of Crowdfunding

\$

There are many ways to make money online, but Kickstarter has taken things to a whole new level using a technique called "Crowdfunding". Through Kickstarter, artists can raise funding for a variety of projects by asking for pledges from the Kickstarter community. While some only make hundreds, others have raised millions using the Kickstarter community to fund their projects. So what's the story behind Kickstarter and Crowdfunding, how does it work, and most importantly... does it work?

Both of us had some hesitation, we were sort of afraid we'd lose some legitimacy in the eyes of other scientists. It's not a peer-reviewed process. I was just ready to do anything it took to do my research.

Dr. Gee speaking to the New York Times

The #SciFund Challenge

Welcome!

108 scientists have already signed up for the #SciFund Challenge. Will you?

What? The #SciFund Challenge is a grand experiment in science funding. Can scientists raise money for their research by convincing the general public to open their wallets for small-amount donations? In more and more fields – from music to dance to journalism – people are raising lots of money for projects in precisely this way. The process is called crowdfunding. You can think of it as the model charities have always used (bundling lots of donations to do good works), with an internet/social media twist. Can this model work for funding scientific research? Let's find out!

Who? Are you a scientist at any level (from beginning graduate student to emeritus professor) in any discipline? Are you interested in raising money for your research in a new way? Well, we want you to join the #SciFund Challenge!

When? From November 1-December 15, 2011, scientists participating in the #SciFund Challenge will each conduct their own crowdfunding campaigns for their own research. But even though each scientist will be fundraising for their own research, participants won't be on their own. Through the Challenge, participants will be connected together to increase the chances that everyone succeeds.

Where? The #SciFund Challenge will be run through RocketHub, a major crowdfunding platform on the Internet. RocketHub will help to promote #SciFund projects. The Challenge – this blog – is the facilitator to jumpstart scientists to get on board.

What's the cost? It doesn't cost anything to join the #SciFund Challenge. Any money you raise for your research will be entirely yours (minus RocketHub's percentage, which is about 8%).

I don't know anything about crowdfunding. Can I still participate? Yes! Through the #SciFund Challenge blog, we'll be providing direction on how to successfully run a crowdfunding campaign.

How do I learn more? Read the blog!

How long do I have to decide? The sign-up period for the #SciFund Challenge will close on **October 1**.

Global Collaboration Engine (GLOBE)

Evolving New Global Workflows for Land Change Science

GLOBE aims to transform land change science by creating new global scientific workflows that integrate local-, regional- and global-scale researchers, expertise and data based their global relevance using an online collaboration environment leveraging social-computational algorithms and real-time quantitative global and statistical visualization.

Why do we need GLOBE?

People working on GLOBE.

GLOBE couples local and global data and expertise to enable new scientific workflows that accelerate global collaboration, data integration and synthesis for global change research.

It's sort of like facebook.

Dr Tim Oates

I was really impressed with the depth and breadth of the computing expertise at UMBC.

Minipolymath3 project: 2011 IMO

Filed under: [research](#) — Terence Tao @ 8:00 pm

This post marks the official opening of the mini-polymath3 project to solve a problem from the [2011 IMO](#). I have decided to use Q2, in part to see how the polymath format would cope with a more geometrically themed problem.

Problem 2. Let S be a finite set of at least two points in the plane. Assume that no three points of S are collinear. A *windmill* is a process that starts with a line ℓ going through a single point $P \in S$. The line rotates clockwise about the pivot P until the first time that the line meets some other point Q belonging to S . This point Q takes over as the new pivot, and the line now rotates clockwise about Q , until it next meets a point of S . This process continues indefinitely.

Show that we can choose a point P in S and a line ℓ going through P such that the resulting windmill uses each point of S as a pivot infinitely many times.

The comments to this post shall serve as the research thread for the project, in which participants are encouraged to post their thoughts and comments on the problem, even if (or especially if) they are only partially conclusive. Participants are also encouraged to visit the [discussion thread](#) for this project, and also to visit and work on the [wiki page](#) to organise the progress made so far.

This project will follow the [general polymath rules](#). In particular:

1. **All are welcome.** Everyone (regardless of mathematical level) is welcome to participate. Even very simple or “obvious” comments, or comments that help clarify a previous observation, can be valuable.
2. **No spoilers!** It is inevitable that solutions to this problem will become available on the internet very shortly. If you are intending to participate in this project, I ask that you refrain from looking up these solutions, and that those of you have already seen a solution to the problem refrain from giving out spoilers, until at least one solution has already been obtained organically from the project.
3. **Not a race.** This is **not** intended to be a race between individuals; the purpose of the polymath experiment is to solve problems *collaboratively* rather than individually, by proceeding via a multitude of small observations and steps shared between all participants. If you find yourself tempted to work out the entire problem by yourself in isolation, I would request that you refrain from revealing any solutions you obtain in this manner until *after* the main project has reached at least one solution on its own.
4. **Update the wiki.** Once the number of comments here becomes too large to easily digest at once, participants are encouraged to work on the [wiki page](#) to summarise the progress made so far, to help others get up to speed on the status of the project.
5. **Metacommments go in the discussion thread.** Any non-research discussions regarding the project (e.g. organisational suggestions, or commentary on the current progress) should be made at the [discussion thread](#).
6. **Be polite and constructive, and make your comments as easy to understand as possible.** Bear in mind that the mathematical

Welcome to Galaxy Zoo, where you can help astronomers explore the Universe

Galaxy Zoo: Hubble uses gorgeous imagery of hundreds of thousands of galaxies drawn from NASA's Hubble Space Telescope archive. To understand how these galaxies, and our own, formed we need your help to classify them according to their shapes — a task at which your brain is better than even the most advanced computer. If you're quick, you may even be the first person in history to see each of the galaxies you're asked to classify.

More than 250,000 people have taken part in Galaxy Zoo so far, producing a wealth of valuable data and sending telescopes on Earth and in space chasing after their discoveries. The images used in Galaxy Zoo: Hubble are more detailed and beautiful than ever, and will allow us to look deeper into the Universe than ever before. To begin exploring, click the 'How To Take Part' link above, or read [The Story So Far](#) to find out what Galaxy Zoo has achieved to date.

Thanks for your help, and happy classifying.

TCGA Data Portal Overview

We provide 3 ways to download data: The Cancer Genome Atlas (TCGA) Data Portal provides a platform for researchers to search, download, and analyze data sets generated by TCGA. It contains clinical information, genomic characterization data, and high-throughput sequencing analysis of the tumor genomes.

Announcements

09/26/2011 - Update: NCBI Sequencing Archive

TCGA has arranged with NCBI to temporarily extend maintenance of the TCGA data in the Sequence Read Archive. Users may continue to download TCGA data from NCBI until November 27, 2011. All requests for data retrieval must be submitted by November 27, 2011, and all data downloads must be completed by November 30, 2011. After November 30, NCBI will no longer host sequencing data from TCGA in the Sequence Read Archive. Users can sign up for updates for future TCGA data releases and other TCGA-related information [here](#). For immediate issues, email TCGA@mail.nih.gov.

08/15/2011 - TCGA Scientific Symposium

Join TCGA as it holds its first annual TCGA Scientific Symposium November 17-18, 2011 in Washington D.C. For more information, visit [TCGASymposium](#).

Ecologists Use Power of Network Science to Challenge Long-Held Theory

ScienceDaily (Sep. 23, 2011) — For decades, ecologists have toiled to nail down principles explaining why some habitats have many more plant and animal species than others.

study plots," says Utah State University plant ecologist Peter Adler.

Scientists say Adler's and his colleagues' findings represent a significant advance in ecological thought. The findings appear in the journal *Science*.

"We challenged a prevailing model developed in the early

Much of this debate is focused on the idea that the number of species is determined by the productivity of the habitat.

Shouldn't a patch of prairie contain a different number of species than an arid steppe or an alpine tundra?

Maybe not, says an international team of scientists that pooled its resources to re-evaluate the relationship between species numbers and habitat productivity.

The innovative, standardized global sampling of 48 sites on five continents yielded an unprecedented data set.

"Our study shows no clear relationship between productivity and the number of plant species in small

study plots," says Utah State University plant ecologist Peter Adler.

Scientists say Adler's and his colleagues' findings represent a significant advance in ecological thought. The findings appear in the journal *Science*.

"We challenged a prevailing model developed in the early

Welcome to the Nutrient Network!

NutNet sites

Two of the most pervasive human impacts on ecosystems are alteration of global nutrient budgets and changes in the abundance and identity of consumers. Fossil fuel combustion and agricultural fertilization have doubled and quintupled, respectively, global pools of nitrogen and phosphorus relative to pre-industrial levels. Concurrently, habitat loss and degradation and selective hunting and fishing disproportionately remove consumers from food webs. At the same time, humans are adding consumers to food webs for endpoints such as conservation, recreation, and agriculture, as well as accidental introductions of invasive consumer species. In spite of the global impacts of these human

The Dragonfly Swarm Project

Dragonfly researchers know that dragonflies swarm. They also know that there are two different kinds of swarms: static feeding swarms (the dragonflies fly repeatedly over a well-defined area and fairly close to the ground, usually feeding on clouds of small insects) and migratory swarms (hundreds to millions of dragonflies flying in a single direction in massive groups, often 15-30 meters above the ground). However, these swarms are very difficult to study because they are

incredibly ephemeral events. You have to be in the right place at the right time to see one and many people will go their entire lives without ever witnessing a swarm.

The [Dragonfly Swarm Project](#) uses the power of the internet to allow everyone to participate in a large-scale study of dragonfly swarming behavior. Participants observe dragonfly swarms wherever they occur, make observations of the composition and behavior of the swarm, then submit a report online. Data is compiled from the reports by an aquatic entomologist with a passion for dragonflies

What is Citizen Science?

Research often involves teams of scientists collaborating across continents. Now, using the power of the Internet, non-specialists are participating, too. Citizen Science falls into many categories. A pioneering project was [SETI@Home](#), which has harnessed the idle computing time of millions of participants in the search for extraterrestrial life. Citizen scientists also act as volunteer classifiers of heavenly objects, such as in [Galaxy Zoo](#). They make observations of the natural world, as in [The Great Sunflower Project](#). And they even solve puzzles to design proteins, such as [FoldIt](#). We'll add projects regularly—and please tell us about others you like as well.

Connecting to Collaborators

The screenshot shows the SciVal Experts platform interface. At the top, the ATHENA University logo is on the left, and the title "SciVal Experts" is on the right. The main content area displays a "Funding Opportunity Details" for a "Research Electives Program" sponsored by "Sponsor 2". The opportunity is for "Research Grants" with an announcement number and classification in Medicine, Biochemistry, Genetics, and Molecular Biology. It has a funding amount of "USD 200,000" and a deadline of "10/31/2011". Below this, a detailed description of the program is provided, mentioning the Tumor Biology Section, Head and Neck Surgery Branch, and Hearing Section, Otolaryngology Branch, National Institute of Deafness and Other Communication Disorders (NIDCD). The program is an eight- to twelve-week elective program for fourth-year medical students, emphasizing research protocols in the outpatient and inpatient setting. The elective includes involvement in clinical research activities of the assigned senior staff mentor. Opportunities include assessment of patients, observation of diagnostic and therapeutic procedures, and observation of patients receiving inpatient surgery or combined chemotherapy and radiation therapy. Students may elect to assist with an intramural research project as part of their experience. The program places emphasis on the molecular and cellular pathogenesis and treatment of disorders affecting hearing, balance, voice, speech, and language. Students will attend NIDCD and Clinical Center Grand Rounds, NIDCD intramural research seminars, and section journal club meetings on a weekly basis.

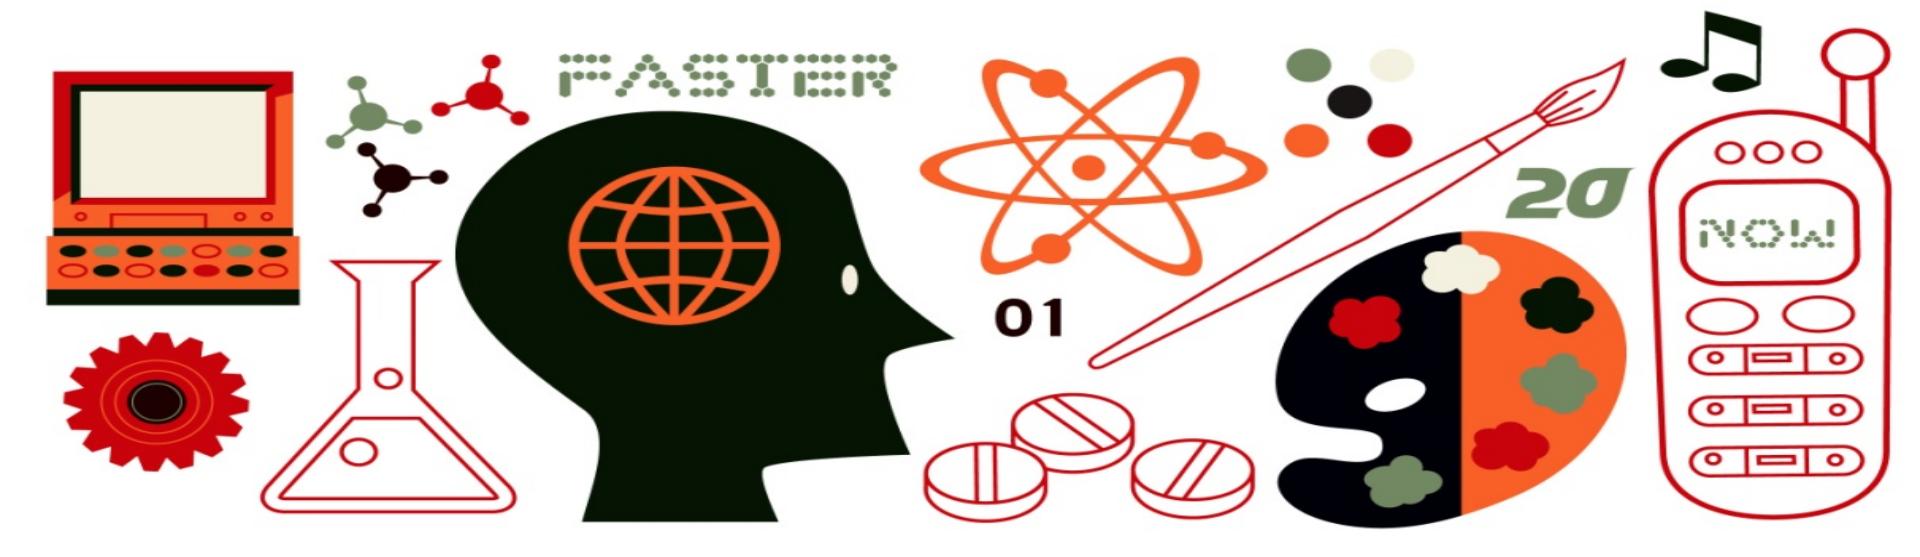

On the right side of the main content area, there is a "Follow-Up" sidebar with options: "Save as bookmark", "Open in SciVal Funding", "Interested in collaboration" (radio button), "Interested" (radio button), and "Not interested" (radio button). Below this is a "Matched contacts" section with "Tumors" and "Chemotherapy". A "Send this Mail" button is also present.

At the bottom of the main content area, there is a "Suggested Collaborators" section listing five researchers with their names, University, and College, along with their publication counts: Researcher 2 (University 1, College of Health Sciences, 17 publications), Researcher 3 (University 1, School of Medicine, 5 publications), Researcher 4 (University 1, College of Natural Resources, 22 publications), and Researcher 5 (University 1, College of Agriculture & Life Sciences, 15 publications).

Receive suggestions for collaborators with whom to pursue the grants and form new partnerships by emailing other researchers from within the tool.

A modal window titled "Send this Mail" is open, showing a message to "Hi, Harry G McKee". The message content is "Researcher 1 wants to contact you". Below the message is a text input field with the placeholder "Put your message here". At the bottom of the modal, there is a "GCA AWARD IN DESERT STUDIES" section with "Garden Club of America" and "USD 4,000" and a "Deadline: Not Specified" note.

Its a wrap!

The Sydney Hackathon 2011 was a roaring success. With 11 applications from 32 contestants. Follow us on the blog, twitter and facebook.

Congratulations to all the winners and competitors, it was an amazing weekend! A full report of the event will go up on the blog very soon! Sydney Hackathon was jointly organised by Sydney University IT Society, University of Sydney School of IT and Elsevier.

[Check out photos on Facebook](#)

24 hours, your apps, your creativity!

Welcome to the first year of the Sydney Hackathon, a 24 hour application development competition which will be held at the University of Sydney, School of Information Technologies, on the 24th to the 25th of September, 2011.

Developers and designers, students from any University in Australia or full time developers, are invited to enter the competition.

Teams of participants compete against each other to develop apps for

The Sydney Hackathon is co-organised by the University of Sydney, Sydney University IT Society and Elsevier.

Thanks to our event sponsors the University of Sydney Union and OrionVM.

Welcome to the Apps for Library Idea Challenge

- Know what your users need but not how to build it?
- Got an idea for how to solve a problem but lack the resources?

Consider your and your users' day to day workflows in SciVerse (what's this?). What is difficult or time consuming or not intuitive?

Accelerate Science

MEET OUR TEN FINALISTS!

The judges have selected ten app ideas to move into the Commenting Round. Check them out and add your opinion (good or bad!):

- ◆ *Determining the number of authors per article*
- ◆ *SciVerse Live Chat*
- ◆ *Visualization of Facets*
- ◆ *Journal Abbreviation Translator*
- ◆ *SciVerse Search with Support**
- ◆ *Vocabulary Mapping*
- ◆ *Journals/Conferences @ Your Fingertips*
*(Uses instant messaging but similar to Live Chat)
- ◆ *Yumetrics or SciMetrics*
- ◆ *JTOCs 2 Go*
- ◆ *Search Aid*

Elsevier is offering \$35,000 to software developers to create apps and help more than 15 million researchers, medical professionals, librarians and students accelerate science

[Follow this challenge](#)

Follow the challenge to stay informed and learn more about submitting.

Thanks for participating. Public voting is now closed, and votes are being verified for eligibility. Check back in October to find out who wins!

About The Challenge

Elsevier is offering \$35,000 in prizes and challenging software developers to help more than 15 million researchers, medical professionals, librarians and students navigate scientific content, improve scientific search and discovery, visualize sophisticated data in more insightful and attractive ways and stimulate collaboration.

Elsevier, the world-leading publisher of scientific, technical and medical information, has opened their vast catalog of scientific content and provided APIs that enable developers to create apps that improve researcher productivity and workflow. Elsevier's trusted content and meta-data integrates more than 10 million full text articles from over 2,500 journals and 11,000 books as well as over 42 million abstracts, citations and web content covering 18,000 titles from over 5,000 publishers.

Developers are encouraged to collaborate with researchers to develop the best apps to enhance the customer experience. Developers will retain full IP rights to their submissions and can host their apps on Elsevier's SciVerse Application Marketplace where they can market their apps and gain revenue from 15 million users in over 10,000 institutions. Apps For Science is open to individual residents and organizations domiciled in seven countries: Australia, India, Japan, Germany, Netherlands, United Kingdom and the United States.
