BANGKOK, THAILAND

BERKELEY, UNITED STATES

BOULDER, UNITED STATES

BRISTOL, UNITED KINGDOM

BYBLOS, LEBANON

CHRISTCHURCH, NEW ZEALAND

DA NANG, VIETNAM

WHAT IS RESILIENCE?

100 Resilient Cities defines resilience as "the capacity of individuals, communities, institutions, businesses and systems within a city to survive, adapt, and grow no matter what kinds of chronic stresses and acute shocks they experience."

Simply put, resilience enables people to bounce back stronger after tough times, and live better in good times. What we have learned from our initiative work over the past several years is that, no matter what the city's conditions, resilient systems share and demonstrate certain core characteristics.

Resilience: Ability to prepare and plan for, absorb, recover from or more successfully adapt to actual or potential adverse events

1979

Great Egg Harbor Inlet, NJ

2013

Why Should a Community Measure its Resilience?

To understand the potential impacts of adverse events & evaluate the capacity of community to respond to, recover from, and adapt to such events.

A resilience measurement tool can help

- assess/prioritize needs and goals
- establish baselines
- monitor progress and recognize success
- understand costs (investments) and benefits (results)
- evaluate the effects of different policies/approaches

What's Been Done? By Whom?

Disaster Resilience: A National Imperative (2012) outlines 17 resilience assessment tools and systems. BUT, there are many, many more!

- ❖ **Developed by** federal agencies, national and international organizations, communities/cities, non-governmental organizations, private sector, academia
- ❖ **Range and purposes vary:** qualitative to quantitative, top down to bottom up, hazard specific to general, narrow to broad, local to global, pre to post event and on it goes

The landscape is messy and littered with indices, indicators, variables, and approaches! How do we find our way forward?

Photo: http://4.bp.blogspot.com/-tUUDOdUb9M4/T4wKttXV6rI/AAAAAAAAAi8/sYqWtj_Dh3A/s1600/MessyDesk28.jpg

What's Out There?

TOP DOWN:	Hyogo Framework for Action (HFA) - United Nations	DFID Interagency Group	San Francisco Planning and Urban Research Association (SPUR)	Baseline Resilience Indicator for Communities (BRIC)	ResilUS	PEOPLES Resilience Framework
Purpose	Prioritize risk reduction (RR) in communities	Shows what a disaster resilient community might look like	Measure ability to recover from earthquakes	Measure overall pre-existing community resilience	recovery over time of critical services and community capital	Holistic framework for designing and measuring resilience
Target categories	Institutions and actions promoting risk reduction, preparedness, response	Governance, risk assessment; knowledge & education; risk management; disaster prepare and response	Buildings and infrastructure, services restoration	Infrastructure, ecosystems, institutions, economic, social, community capacity	Ability to perform; opportunity to perform of critical infrastructure	Population; environment; government services; physical infrastructure; lifestyle; economic; socio-cultural capital
Scale? Who measures? Hazards?	National	Local, national	Local, earthquakes	Local, national comparisons	Local, earthquake case study	Local, no case study
Quant or Qual?	Qualitative	Qualitative	Semi-quantitative	Quantitative	Quantitative	Quantitative, qualitative
Costs to measure	\$\$ 	\$\$ 	\$\$ 	\$ 	\$\$ 	\$\$\$

What Should a Community Expect from its Own Resilience Measurement Tool?

- Open and transparent
- Aligns with the community's goals & vision
- Measurements
 - are simple, well documented
 - can be replicated
 - address multiple hazards
 - represent community's areal extent, physical (manmade and environmental) characteristics, and composition/diversity of community members
 - are adaptable and scalable to different community sizes, compositions, changing circumstances

Developing Community-Based Resilience Measures—What's Important?

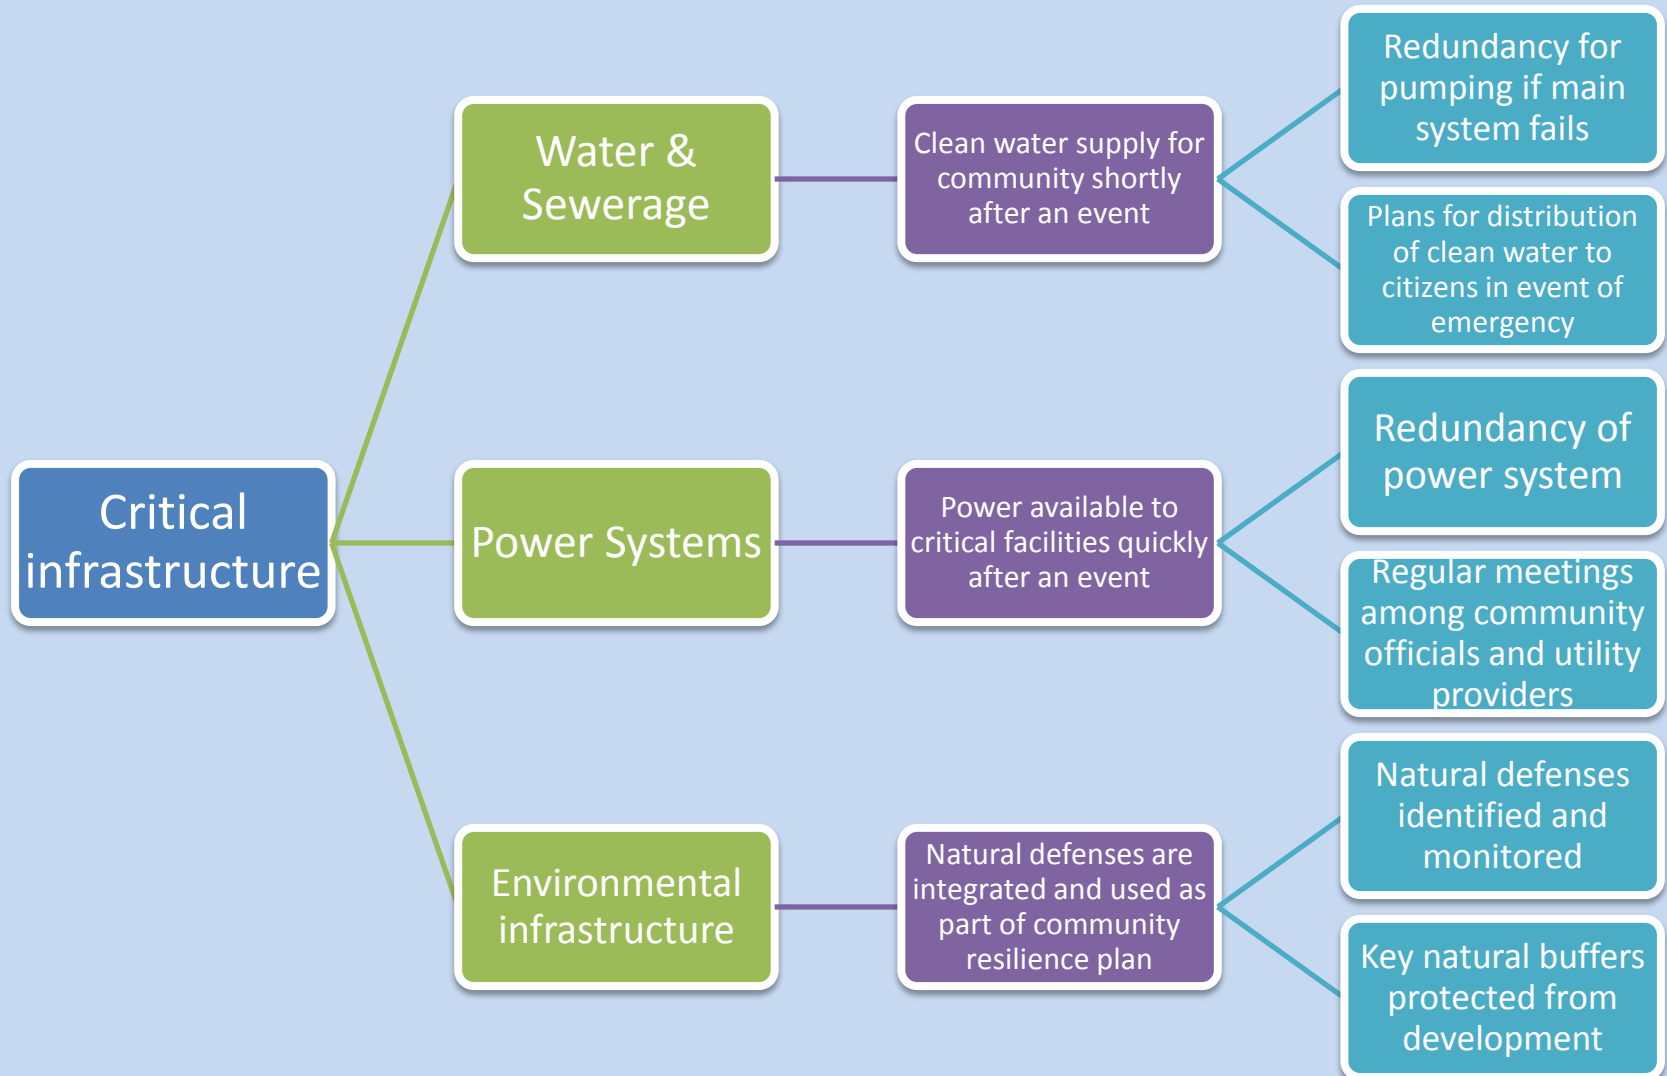

Goal: To increase community's overall resilience to adverse events

Four overarching target categories in the *Disaster Resilience* report:

1. **Critical Infrastructure** (components = power, water, environment, communication...)
2. **Social factors** (components = financial structure, governance, community networks...)
3. **Buildings, structures** (components = businesses, homes, bridges...)
4. **Vulnerable populations** (components = minority status, health, mobility, education...)

Example: Critical Infrastructure

Target Category	Components	Objectives	Measures/Indicators	Challenges/Incentives	Costs
Critical & Environmental Infrastructure	Water & Sewage				
	Power Systems				
	Communications				
	Environmental				
Social Infrastructure	Governance				
	Economic				
	Institutional				
	Language				
Buildings & Built Infrastructure	Commercial				
	Residential				
	Institutional				
	Bridges/Roads				
Vulnerable Populations	Special needs	Identify and locate by address	Nursing home residents, infirmed, homeless	Need inventory from each facility	\$\$
	Mobility limited	Assess needs for evacuation	Population without private cars or public transportation	Census collects	\$
	Incarcerated	Planning and preparedness	population in prisons, mental institutions	Need inventory from each facility	\$\$
	Elderly, children	Locate and determine needs	Dependency ratio (those not in the workforce supported by those in it)	Not collected annually	\$

Why Resilience?

Increasing resilience helps to save lives and money before an event occurs and builds stronger, safer, and more secure communities.

- Helps in understanding current levels of exposure and potential impacts from adverse events, thereby helping a community take responsibility for its own disaster risk.
- Helps identify the community's capacity to cope with adverse effects and where improvements are needed.
- Fosters a culture of self-sufficiency, helping-behavior and betterment.
- Fosters cooperation among all members of the community in working toward a common goal.
- A resilience measurement tool can help by
 - Assessing/prioritizing needs and goals
 - Establishing baselines for monitoring progress and recognizing success
 - Understanding costs (investments) and benefits (results)
 - Evaluating the effects of different policies/approaches

But.....

- A single, one-size metric for all facets of resilience may not work at the bottom-up community scale.
- Lots of tools out there, few are used (too complex, too simple, not known.....)
- Communities have potential to develop or adapt simple measurement systems/tools to gauge their own baselines.
- Measurement tools are helpful in identifying disaster risk, taking steps toward reducing it, assessing how they are doing, and getting stakeholders to work together.

Measurement tools cannot **create** a resilient community, but they can help show the path towards becoming safer, stronger, and more vibrant in the face of unanticipated events.

Satellite images from Google Maps show the Red River and Rivershore Drive S in Moorhead north of Interstate 94. The dashed line in the river is the state line of North Dakota and Minnesota. Most homes on this stretch of that road were bought out in 2010. <http://minnesota.publicradio.org/collections/special/2013/floods/before-after-homes/#2>
