Data Scientist @NASA/JPL

- **Principal Investigator** for NASA AIST OceanWorks
- **Project Technologist** for the NASA's Physical Oceanography Distributed Active Archive Center (PO.DAAC) –
<http://podaac.jpl.nasa.gov>
- **Co-Investigator and Architect** for the NASA Sea Level Change Portal – <https://sealevel.nasa.gov>
- **Architect** for Tactical Data Science Framework for Naval Research
- **Chair** for The Federation of Earth Science Information Partners (ESIP) Cloud Computing Cluster
- **Previously Principal Investigator / Co-Investigator** in several NASA-funded Big Data Analytic Projects
 - OceanXtremes: Oceanographic Data-Intensive Anomaly Detection and Analysis Portal –
<https://oceangoingxtrmes.jpl.nasa.gov>
 - Distributed Oceanographic Matchup Service (DOMS) –
<https://doms.jpl.nasa.gov>
 - Mining and Utilizing Dataset Relevancy from Oceanographic Datasets (MUDROD)
 - Enhanced Quality Screening for Earth Science Data –
<https://vqss.jpl.nasa.gov>
 - NEXUS - Big Data Analytic on the Cloud

NASA Sea Level Change Portal – <https://sealevel.nasa.gov>

Goal for the NASA Sea Level Change Team

- Determine how much will sea level rise by [2100]?
- What are the key sensitivities?
- Where are the key uncertainties? Observables? Model Improvements

Goals for the NASA Sea Level Change Portal

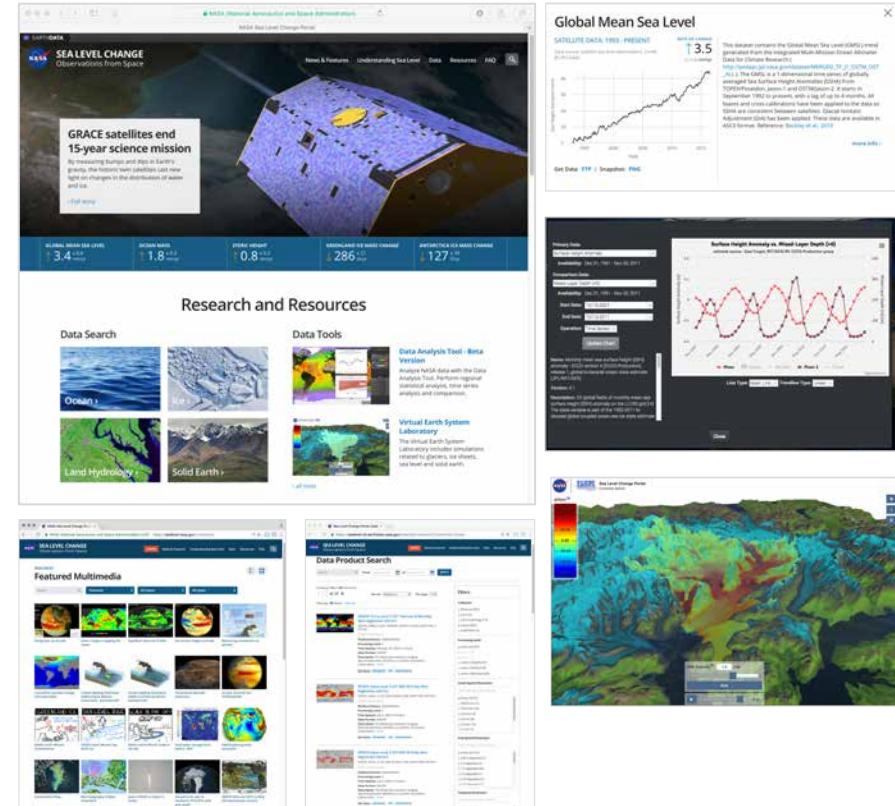

- Provide scientists and the general public with a “one-stop” source for current sea level change information and data
- Provide interactive tools for analyzing and viewing regional data
- Provide virtual dashboard for sea level indicators
- Provide latest news, quarterly report, and publications
- Provide ongoing updates through a suite of editorial products

Requires

- Interdisciplinary collaboration
- Connect disciplines and evaluate dependencies

Sea Level Change Portal facilitates

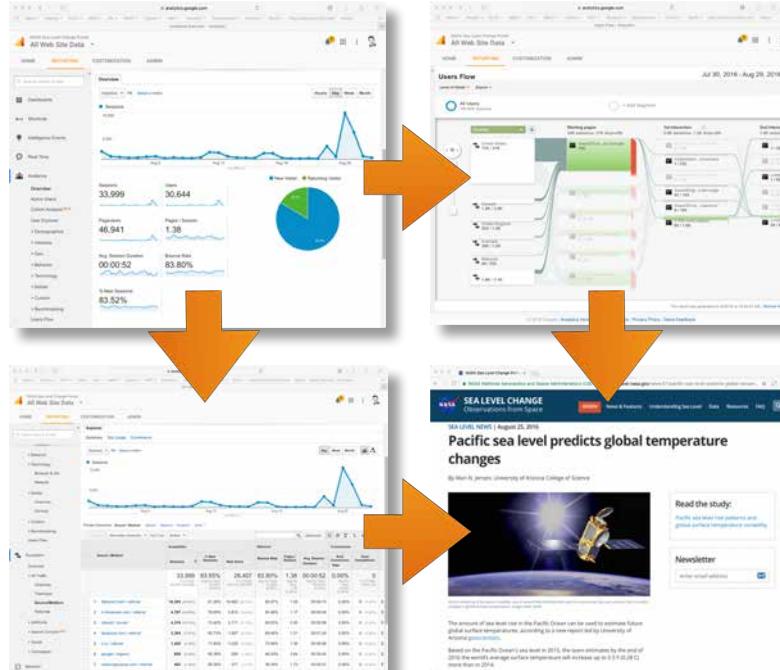

- Easy interdisciplinary data comparison
- Access to latest news and information
- Collaboration (data and information exchange)

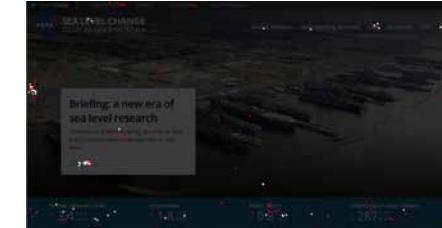

Analyze User Interactions

- Guide website layout
- Determine effectiveness of articles and contents
- Identify popular media outlines
- New and returning users

Latitude/Time Hovmöller | Etc.

Big Data and Data Centers

- **Increasing “big data” era is driving needs to**
 - Scale computational and data infrastructures
 - Support new methods for deriving scientific inferences
 - Shift towards integrated data analytics
 - Apply computation and data science across the lifecycle
- **For NASA Data Centers, with large amount of observational and modeling data, downloading to local machine is becoming inefficient**
- **Reality with large amount of observational and modeling data**
 - Downloading to local machine is becoming inefficient
 - Search has gotten a lot faster. Too many matches
 - Finding the relevant measurement has becoming a very time consuming process *“Which SST dataset I should use?”*
 - Analyze decades of regional measurement is labor-intensive and costly
- **Limitations**
 - Little to no interoperability between tools and services: metadata standard, keyword, spatial coverage (0-360 or -180..180), temporal representation, etc.
 - Making sure the most relevant measurements return first
 - Visualization is nice, but it doesn’t provide enough information about the event/phenomenon captured in the image.
 - With large amount of observational data, data centers need to do more than just storing bits

NASA's Upcoming Big Data Mission: Surface Water and Ocean Topography (SWOT)

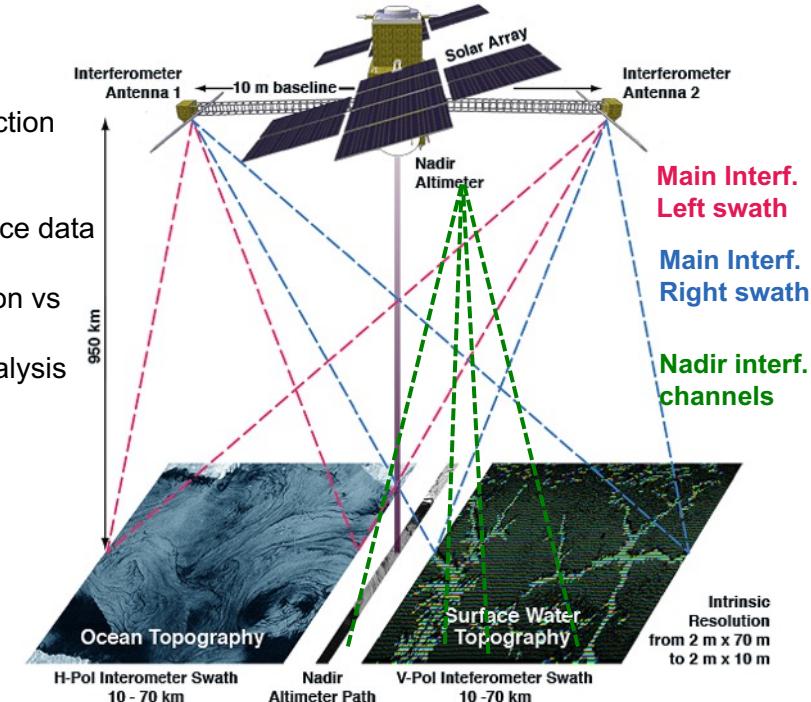

Oceanography: Characterize the ocean mesoscale and sub-mesoscale circulation at spatial resolutions of 10 km and greater.

Hydrology: To provide a global inventory of all terrestrial water bodies whose surface area exceeds $(250\text{m})^2$ (lakes, reservoirs, wetlands) and rivers whose width exceeds 100 m (requirement) (50 m goal) (rivers).

- To measure the global storage change in fresh water bodies at sub-monthly, seasonal, and annual time scales.
- To estimate the global change in river discharge at sub-monthly, seasonal, and annual time scales.

SWOT changes how PO.DAAC operates

- Infrastructure
- Cloud storage selection (Object store, AWS Glacier)
- Interface with science data system
- On-the-fly generation vs long-term store
- Distribution and analysis services

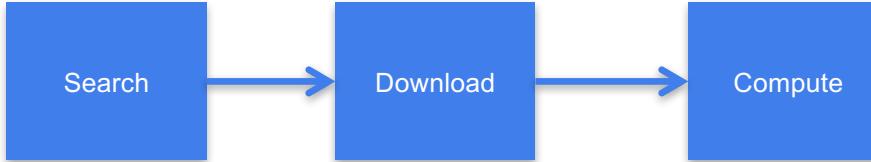

- **Data Volume:**
 - 17PB of original data
 - 6 PB of reprocessed data
- **Total of about 23PB for a nominal 3-year mission**
- **Add roughly 450TB/month for any mission extension**

Launches April of 2021
<https://swot.jpl.nasa.gov>

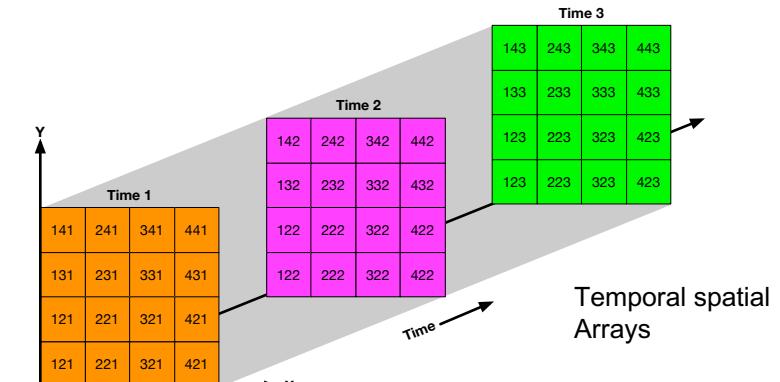

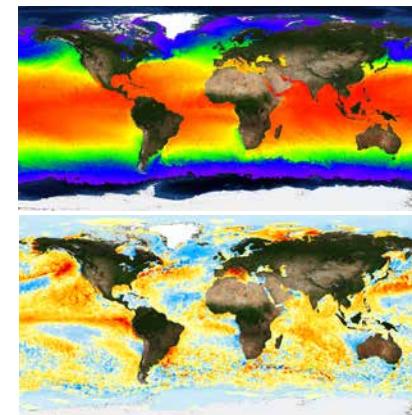

Traditional Method for Analyze Satellite Measurements

- Depending on the data volume (size and number of files)
- It could take many hours of download – (e.g. 10yr of observational data could yield thousands of files)
- It could take many hours of computation
- It requires expensive local computing resource (CPU + RAM + Storage)
- After result is produced, purge downloaded files

Observation

- Traditional methods for data analysis (time-series, distribution, climatology generation) can't scale to handle large volume, high-resolution data. They perform poorly
- Performance suffers when involve large files and/or large collection of files
- A high-performance data analysis solution must be free from file I/O bottleneck

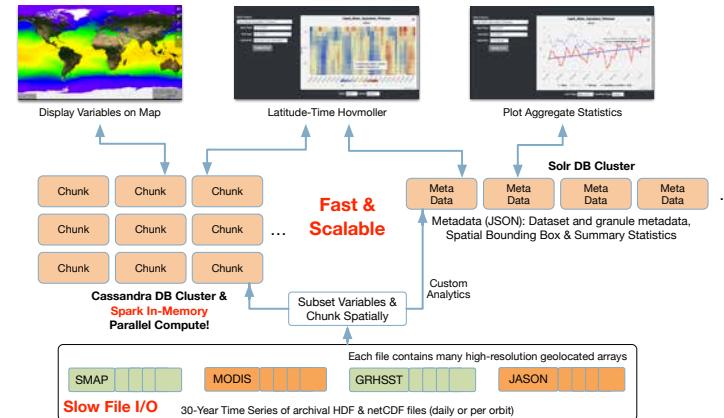

NEXUS: Scalable Data Analytic Solution

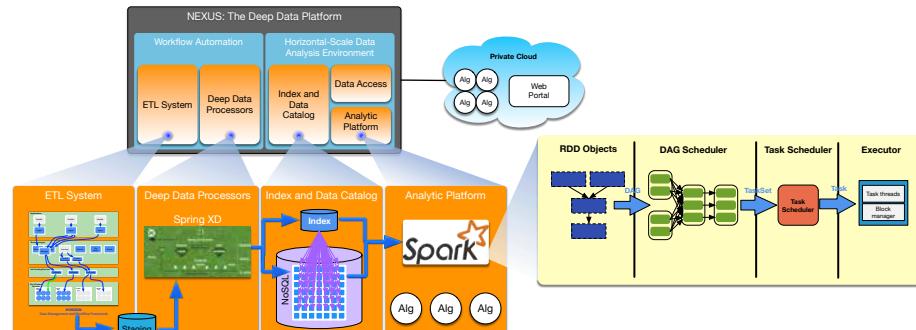

- NEXUS is a data-intensive analysis solution using a new approach for handling science data to enable large-scale data analysis
- Streaming architecture for horizontal scale data ingestion
- Scales horizontally to handle massive amount of data in parallel
- Provides high-performance geospatial and indexed search solution
- Provides tiled data storage architecture to eliminate file I/O overhead
- A growing collection of science analysis webservices using Apache Spark: parallel compute, in-memory map-reduce framework
- Pre-Chunk and Summarize Key Variables
 - Easy statistics instantly (milliseconds)
 - Harder statistics on-demand using Spark (in seconds)
 - Visualize original data (layers) on a map quickly (Cassandra store)
- **Algorithms** – Time Series | Latitude/Time Hovmöller| Longitude/Time Hovmöller| Latitude/Longitude Time Average | Area Averaged Time Series | Time Averaged Map | Climatological Map | Correlation Map | Daily Difference Average

Open Source: Apache License 2

Two-Database Architecture

NEXUS Performance: Custom Spark vs. AWS EMR

Dataset: MODIS AQUA Daily

Name: Aerosol Optical Depth 550 nm (Dark Target) (MYD08_D3v6)

File Count: 5106

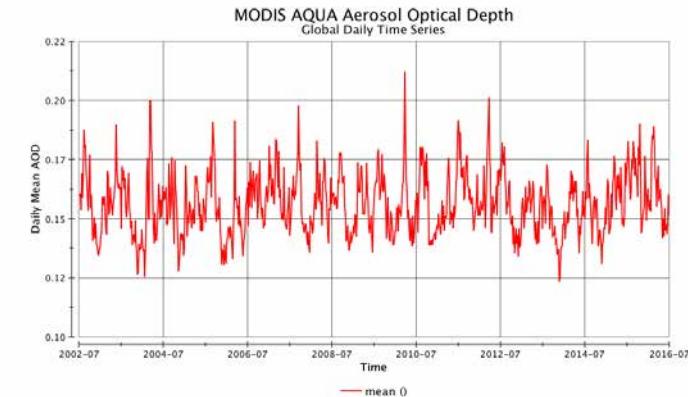

Volume: 2.6GB

Time Coverage: July 4, 2002 – July 3, 2016

Giovanni: A web-based application for visualize, analyze, and access vast amounts of Earth science remote sensing data without having to download the data.

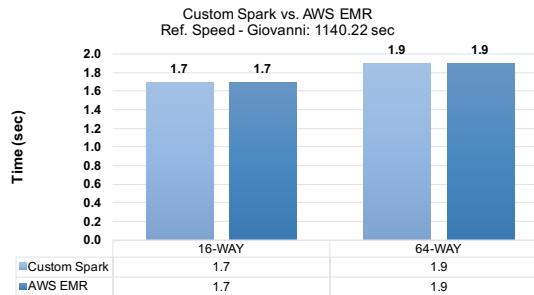

- Represents current state of data analysis technology, by processing one file at a time
- Backed by the popular NCO library. Highly optimized C/C++ library

AWS EMR: Amazon's provisioned MapReduce cluster

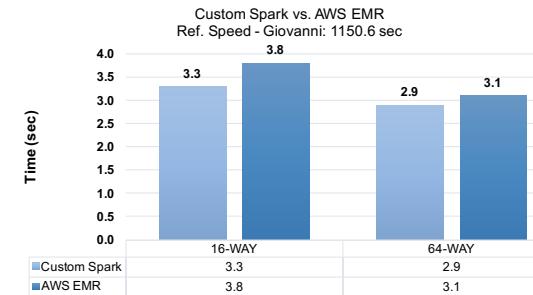

Area Averaged Time Series on AWS - Boulder

July 4, 2002 - July 3, 2016
NEXUS Performance

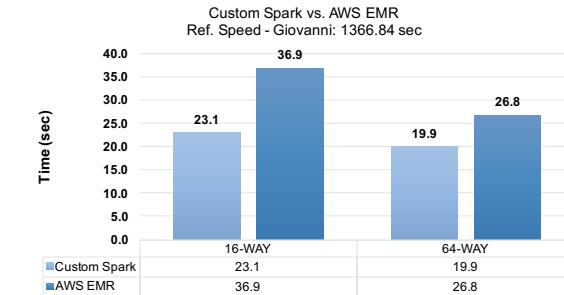

Area Averaged Time Series on AWS - Colorado

July 4, 2002 - July 3, 2016
NEXUS Performance

Area Averaged Time Series on AWS - Global

July 4, 2002 - July 3, 2016
NEXUS Performance

Analyze Ocean Anomaly – “The Blob”

- **Visualize** parameter
- **Compute** daily differences against climatology
- **Analyze** time series area averaged differences
- **Replay** the anomaly and visualize with other measurements
- **Document** the anomaly
- **Publish** the anomaly

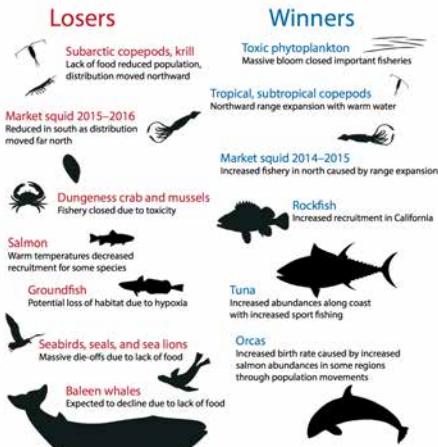

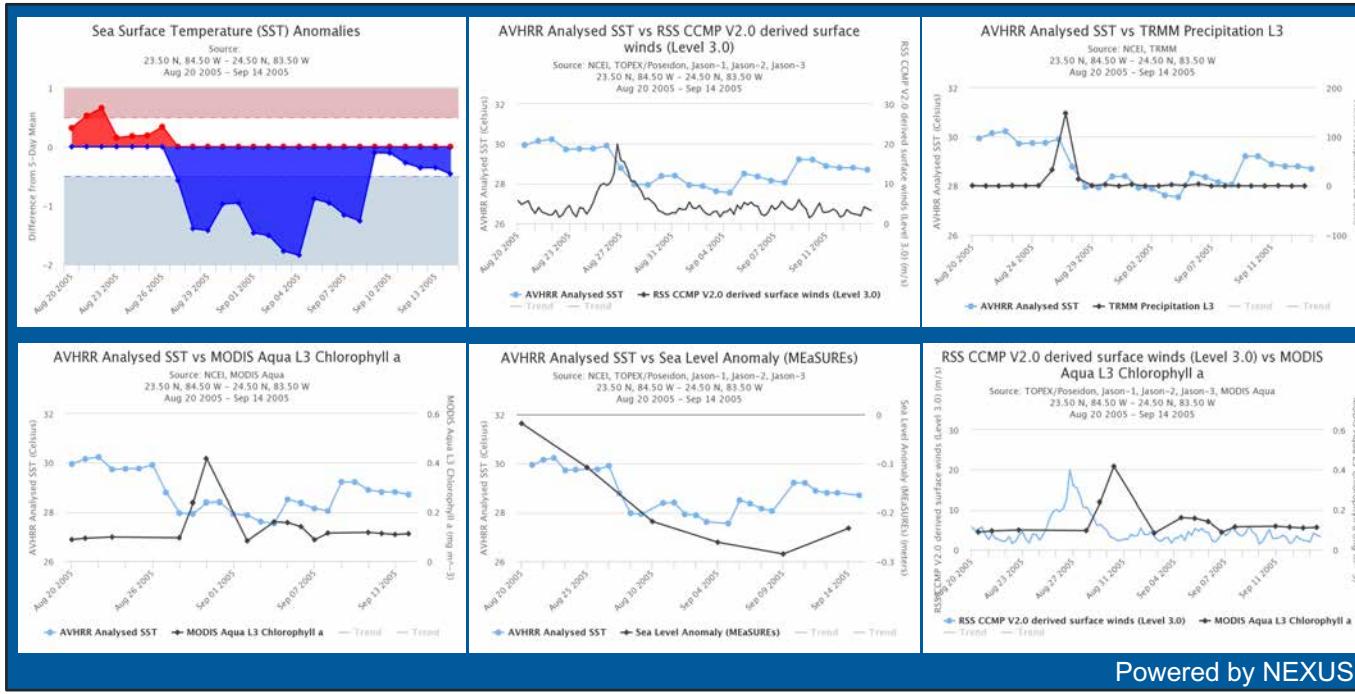

Figure from Cavole, L. M., et al. (2016). "Biological Impacts of the 2013–2015 Warm-Water Anomaly in the Northeast Pacific: Winners, Losers, and the Future." Oceanography 29.

Hurricane Katrina Study

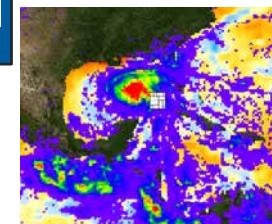

Powered by NEXUS

A study of a Hurricane Katrina-induced phytoplankton bloom using satellite observations and model simulations
Xiaoming Liu, Menghua Wang, and Wei Shi
JOURNAL OF GEOPHYSICAL RESEARCH, VOL. 114, C03023, doi:10.1029/2008JC004934, 2009

Hurricane Katrina passed to the southwest of Florida on Aug 27, 2005. The ocean response in a 1 x 1 deg region is captured by a number of satellites. The initial ocean response was an immediate cooling of the surface waters by 2 °C that lingers for several days. Following this was a short intense ocean chlorophyll bloom a few days later. The ocean may have been “preconditioned” by a cool core eddy and low sea surface height.

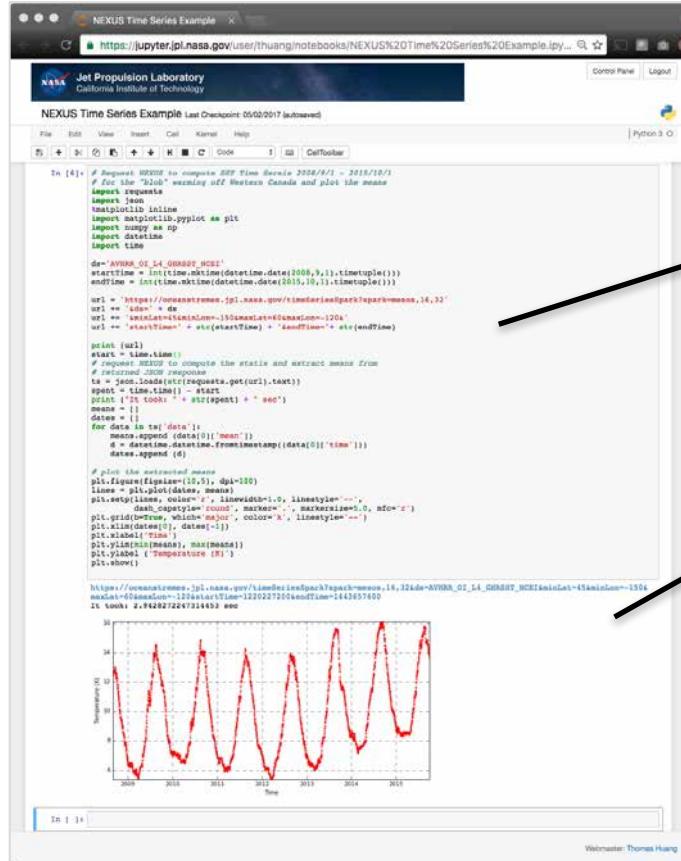

The SST drop is correlated to both wind and precipitation data. The Chl-A data is lagged by about 3 days to the other observations like SST, wind and precipitation.

Hurricane Katrina TRMM overlay SST Anomaly

Developing Information Discovery Solutions

Search and Discovery

- **Search** – look for something you expect to exist
 - Information tagging
 - Indexed search technologies like Apache Solr or ElasticSearch
 - The solution is pretty straightforward
- **Discovery** – find something new, or in a new way
 - This is non-trivial
 - Traditional ontological method doesn't quite add up
 - The strength of semantic web is in inference
 - What happen when we have a lot of **subClassOf**, **equivalentClassOf**, **sameAs**?
 - How wide and deep should we go?
- **Relevancy**
 - It is domain-specific
 - It is personal
 - It is temporal
 - It is dynamic

Search Recommendation
Based on dataset metadata content and web session co-occurrence

In Situ to Satellite Matchup

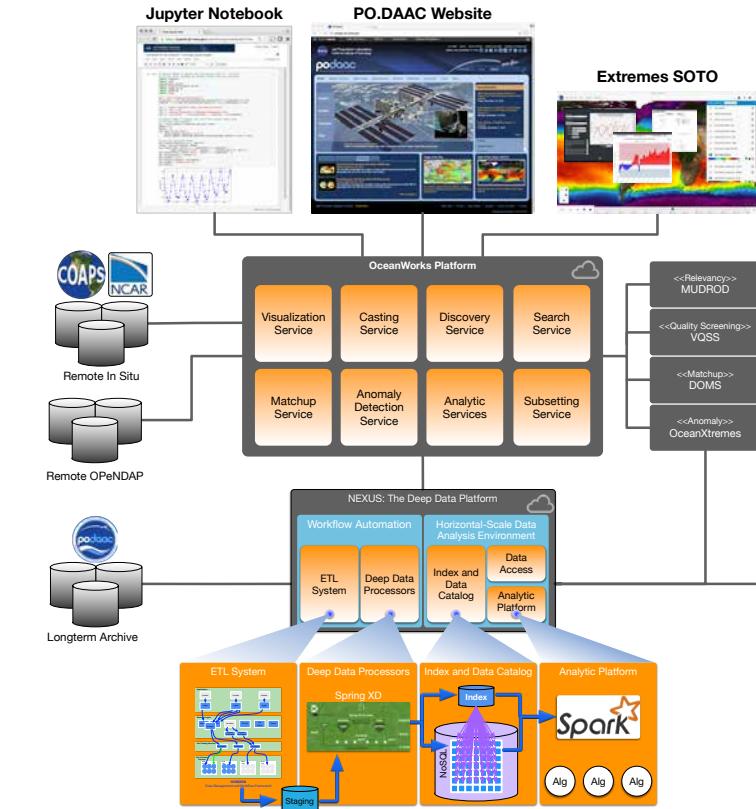

- Distributed Oceanographic Matchup Service
- Typically data matching is done using one-off programs developed at multiple institutions
- A primary advantage of DOMS is the reduction in duplicate development and man hours required to match satellite/in situ data
 - Removes the need for satellite and in situ data to be collocated on a single server
 - Systematically recreate matchups if either in situ or satellite products are re-processed (new versions), i.e., matchup archives are always up-to-date.
- In situ data nodes at JPL, NCAR, and FSU operational.
- Provides data querying, subset creation, match-up services, and file delivery operational.
- Prototype graphical user interface (UI) and APIs accessible for external users.
- Plugin architecture for in situ data source using EDGE
 - Extensible Data Gateway Environment is an Apache License 2 open source technology
 - <https://github.com/dataplumber/edge>
- Defined specification for packaging matchup results. Working with Unidata and ESDSWG's data interoperability and standard groups

AIST OceanWorks

- OceanWorks is to establish an **Integrated Data Analytic Center** at the NASA Physical Oceanography Distributed Active Archive Center (PO.DAAC) for Big Ocean Science
- Focuses on technology integration, advancement and maturity
- Collaboration between JPL, FSU, NCAR, and GMU
- Bringing together PO.DAAC-related big data technologies
 - **OceanXtremes** – Anomaly detection and ocean science
 - **NEXUS** – Big data analytic platform
 - **Data Container Studies**
 - **DOMS** – Distributed in-situ to satellite matchup
 - **MUDROD** – Search relevancy and discovery – linking datasets, services, and anomalies through recommendations
 - **VQSS** – Virtualized Quality Screening Service

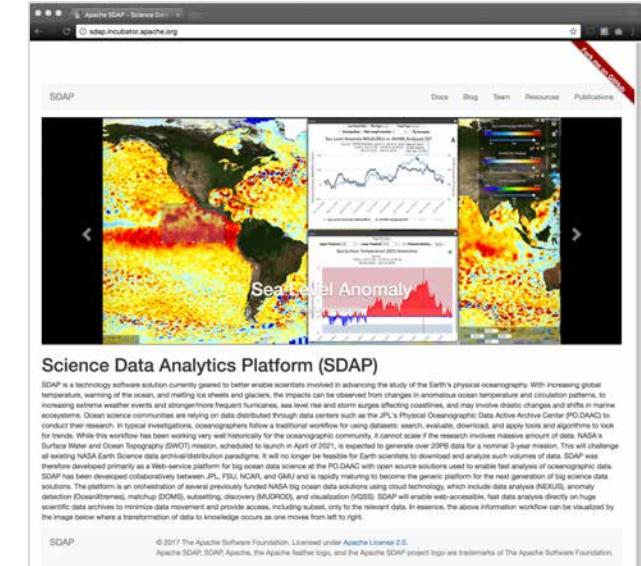

Open Source

- Technology sharing through Free and Open Source Software (FOSS)
- Further technology evolution that is restricted by projects / missions
- **Science Data Analytic Platform (SDAP)**, the implementation of **OceanWorks**, in **Apache Incubator**
 - Cloud platform
 - Analyzing satellite and model data
 - In situ data analysis and coordination with satellite measurements
 - Fast data subsetting
 - Mining of user interactions and data to enable discovery and recommendations
 - Streamline deployment through container technology

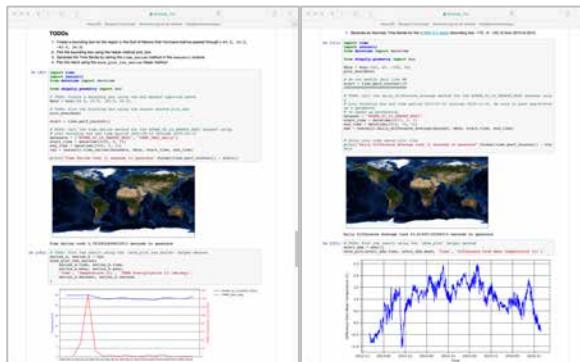

<http://sdap.incubator.apache.org>

Community Engagement and Support

- Develop in the open
- Working with Apache Incubator
- Target Apache top-level project by 2019.
- Public hands-on workshops
- Organize technical sessions at conferences
- Invited speaker and panelist
- Lead Editor: 2018 Wiley Book on **Big Earth Data Analytics in Earth, Atmospheric and Ocean Sciences**

Analyze Hurricane Katrina by comparing SST and TRMM time series

Generate daily difference average
"The Blob" is an oceanographic anomaly

Each participant deployed 3 computing clusters, a total of 24 containers on EC2

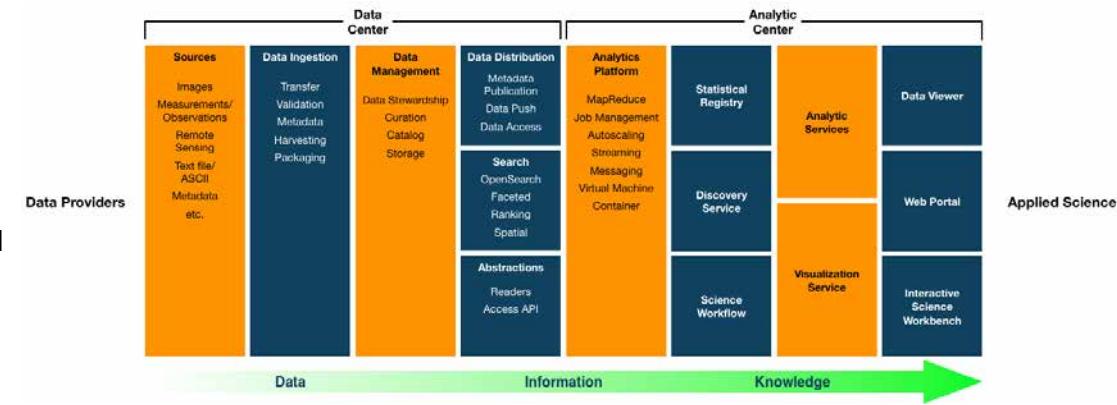

In Summary

- Traditional method for scientific research (search, download, local number crunching) is unable to keep up
- Think beyond the archive
- Connected information enables discovery
- Community developed solution through open sourcing
- Thanks to the NASA ESTO/AIST and Sea Level Rise programs, and the NASA ESDIS project
- Investment in data and computational sciences
- Data Centers need to be in the business of Enabling Science!
- OceanWorks infusion 2018 – 2019
 - Watch for changes to the Sea Level Change Portal
 - Even faster analysis capabilities
 - More variety of measurements – satellites, in situ, and models
 - Event more relevant recommendations
 - NASA's Physical Oceanography Distributed Active Archive Center (PO.DAAC)
