

Thoughts on Inter-operable Metadata for Data Quality, Transparency, and Reproducibility

CNSTAT Panel Study on
Transparency and Reproducibility of Federal Statistics for NCSES

Francisco Moris, Ph.D.

www.ncses.nsf.gov

21 May 2019

What to expect

- Take-aways
- Definitions & Inter-operability in U.S. Data Policy
- Challenges and opportunities
- Scenarios with possible outcomes
- Questions for the Panel

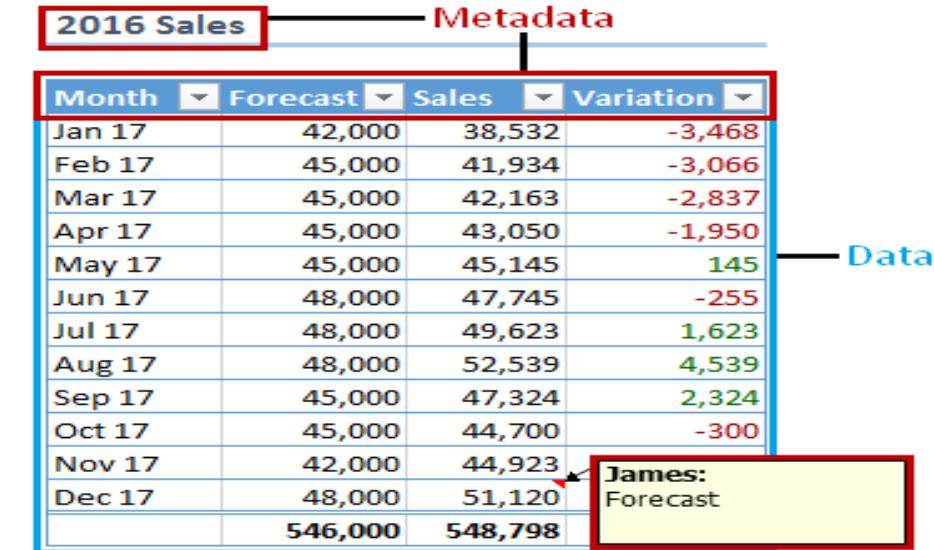

Take-aways

- **Inter-operable** metadata – metadata that can be used across surveys & IT platforms – & **selected core** [cross-agency] metadata
 - has the potential to contribute to **quality and transparency goals** reaffirmed in recent data policy.
- Metadata are also important for **dissemination and data integration** with administrative & other Big Data.
- However, developing inter-operable metadata (within or across agencies) is challenging and remain an **elusive goal that can benefit** from the work by this Panel.

Definitions

- “Metadata is defined to be **data that defines and describes** other data”. “Since metadata are data, then metadata can be stored in a database...” (ISO/IEC 11179). Focus of presentation: statistical metadata.
- Metadata types by content:
 - data description: variable names, units, frequency; sectors (~labels in tables)- ‘*structural metadata*’
 - concepts, definitions, methodology - ‘*reference metadata*’
 - microlevel detail on collection or processing - ‘*paradata*’
- by format: textual ‘documentation’ vs. machine-readable (e.g. coded metadata fields or variables)
- by scope: metadata about microdata, aggregate estimates, datasets, linkages, etc.

A spreadsheet

Month	Forecast	Sales	Variation
Jan 17	42,000	38,532	-3,468
Feb 17	45,000	41,934	-3,066
Mar 17	45,000	42,163	-2,837
Apr 17	45,000	43,050	-1,950
May 17	45,000	45,145	145
Jun 17	48,000	47,745	-255
Jul 17	48,000	49,623	1,623
Aug 17	48,000	52,539	4,539
Sep 17	45,000	47,324	2,324
Oct 17	45,000	44,700	-300
Nov 17	42,000	44,923	
Dec 17	48,000	51,120	
	546,000	548,798	

Spreadsheets contain a few metadata fields:

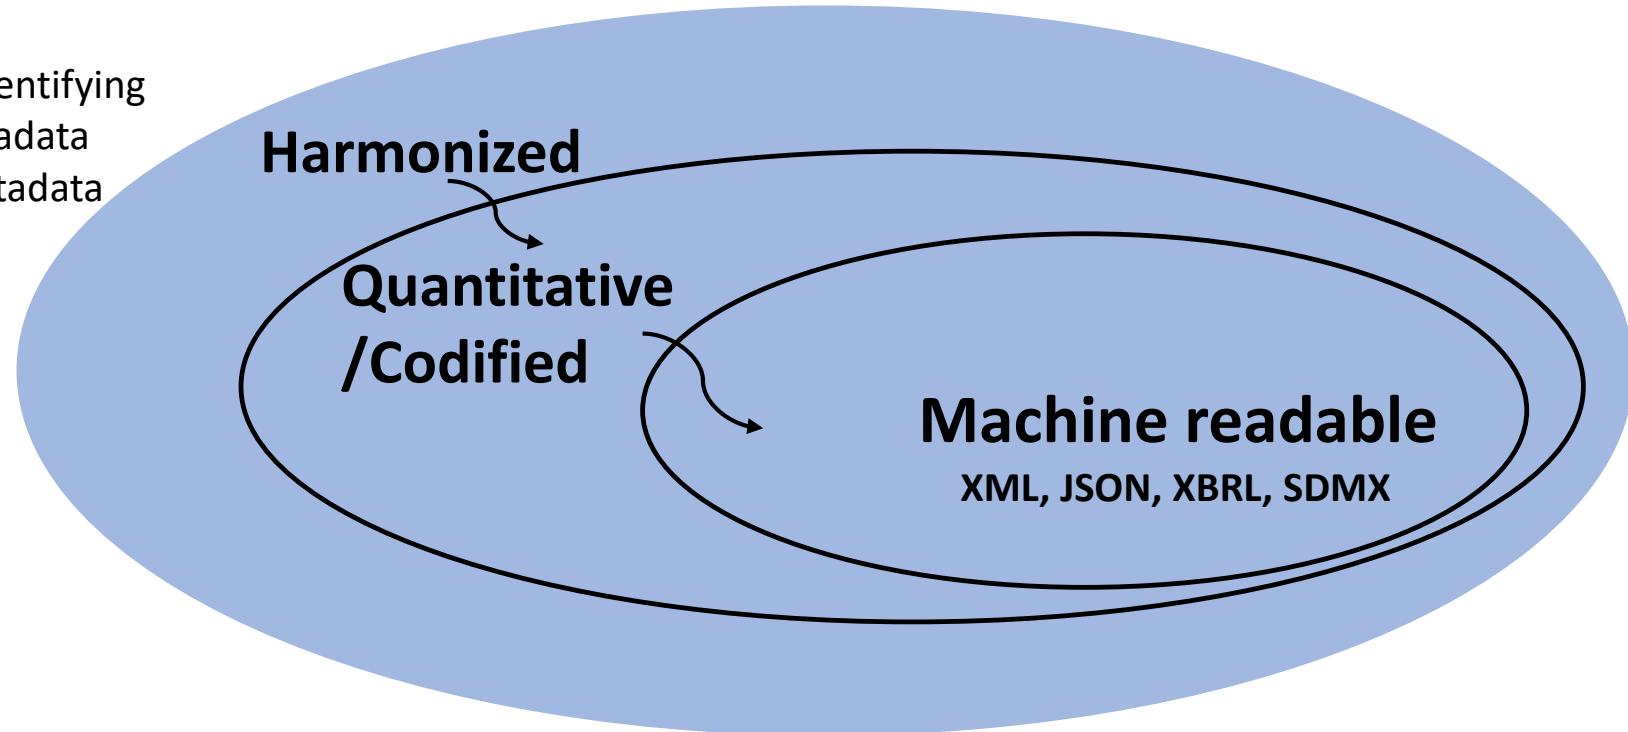

- tab names,
- table names,
- column names,
- user comments.

Definition & Stages or degrees of Inter-operable Metadata

Inter-operable metadata: able to be shared or used across surveys & IT systems.

Three stages or degrees:

Harmonization: identifying selected core metadata
e.g., Common Metadata Vocabulary

Stages or degrees of Inter-operable Metadata

Harmonization of statistical metadata is perhaps the most difficult step - needs consensus from

- relatively autonomous units and/or
- specialized communities of practice.

But there are also examples of harmonized metadata for Federal, commercial, and international data.

Examples of harmonized metadata

- Cross-agency metadata standards for geographic and geospatial data: FGDC (since 1990s) & Geospatial Data Act 2018 (PL 115-254)
- Convergence of voice, data, and video in telecommunications leading to today's mobile devices and emerging 'IoT'
- Eurostat, OECD, and Central Banks cross-country metadata tools for socio-economic data

Inter-operable data and metadata supports U.S. Data Policy...

1- OPEN Government DATA Act -Title II of Foundations for Evidence-Based Policymaking Act (2019)

“Federal Agency Responsibilities to Make Data Open by Default”:

Open/transparent data: “Open government data asset means a public data asset that is—

- (A) **machine-readable**; [“format that can be easily processed by a computer without human intervention”]
- (B) available (or could be made available) in an open format;
- (C) not encumbered by restrictions, other than IP rights...and
- (D) based on an underlying open standard that is maintained by a standards organization”.

Inter-operable data and metadata supports U.S. Data Policy...

2- OMB M-19-15 Improving Implementation of Information Quality Act (April 2019) – Cites M-13-13 & A-130

“Reproducibility requires... transparency about methods..,
design...parameters...”

M-13-13: “...establishes a framework to ...promote interoperability and openness
[transparency].... This includes using machine-readable and open formats, ...and
common core and extensible metadata.”

A-130 Managing Information as a Strategic Resource (2016): “...information in a way
that supports downstream interoperability among information systems and streamlines
dissemination...in machine-readable open formats, using relevant data
standards...includes standard extensible metadata...”

3- Federal Data Strategy (ongoing)

Practice 2: “Inventory Data Assets with sufficient ...quality, and metadata to facilitate
...discovery, access, and use.” Practice 6: “Publish Data Documentation: ...in publicly
accessible digital repositories”

... metadata also supports integrating data from multiple sources

Recent guidance & reports on data integration
cover the role of metadata:

- OMB M-14-06 Guidance for Providing & Using Administrative Data for Statistical Purposes
- Data Quality Assessment Tool for Administrative Data (FCSM 2013)
- Federal Statistics, Multiple Data Sources, and Privacy Protection, Next Steps (NASEM 2017)

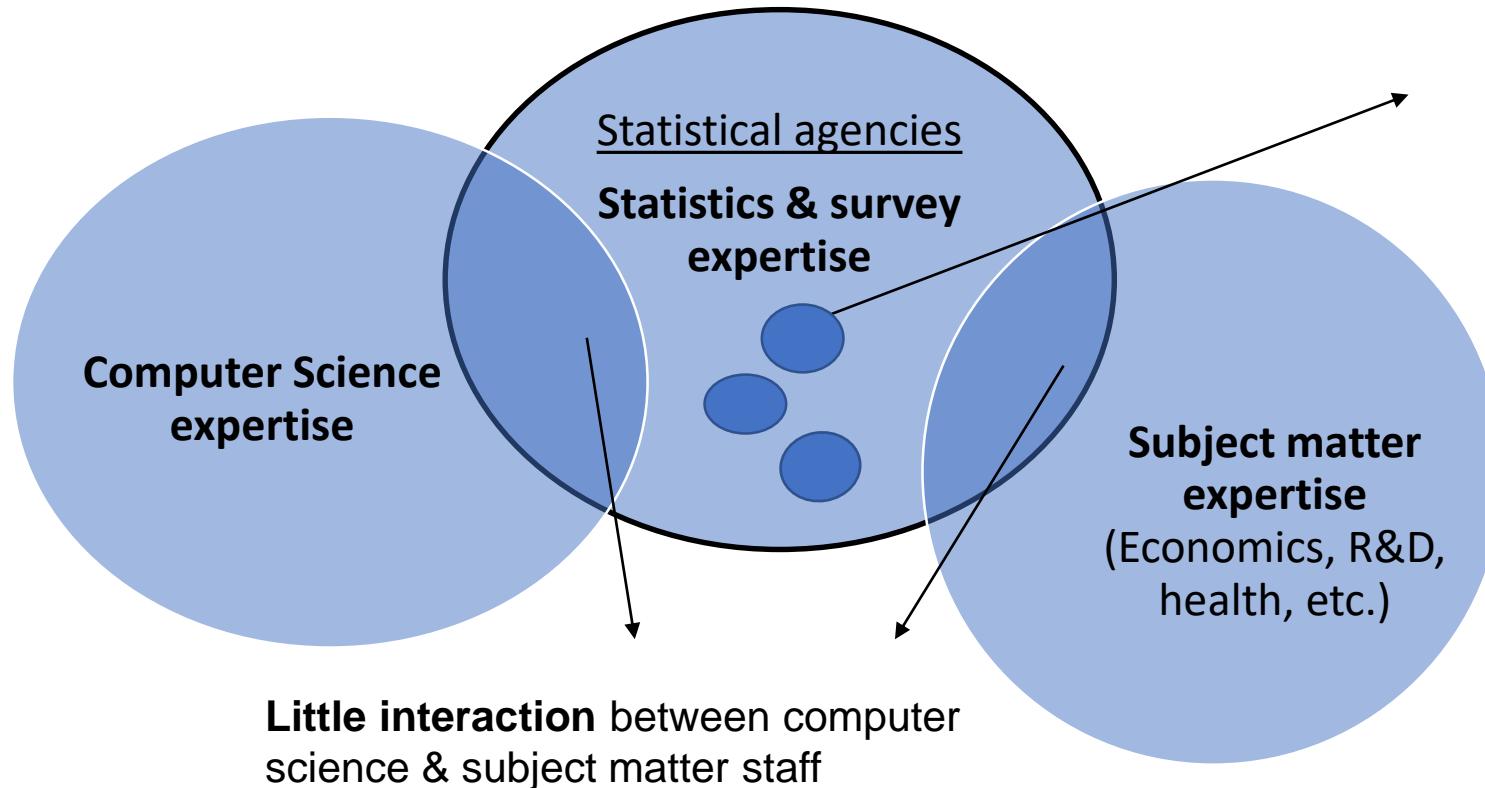

Challenges and opportunities for statistical metadata

- Great agency-specific metadata tools and Federal research on metadata – as illustrated in presentations later today!

Challenges and opportunities for statistical metadata

- At the same time, harmonizing and enhancing metadata systems is expensive and time-consuming.
- Technical and organizational challenges may also result in metadata silos.

Challenges in harmonizing statistical metadata

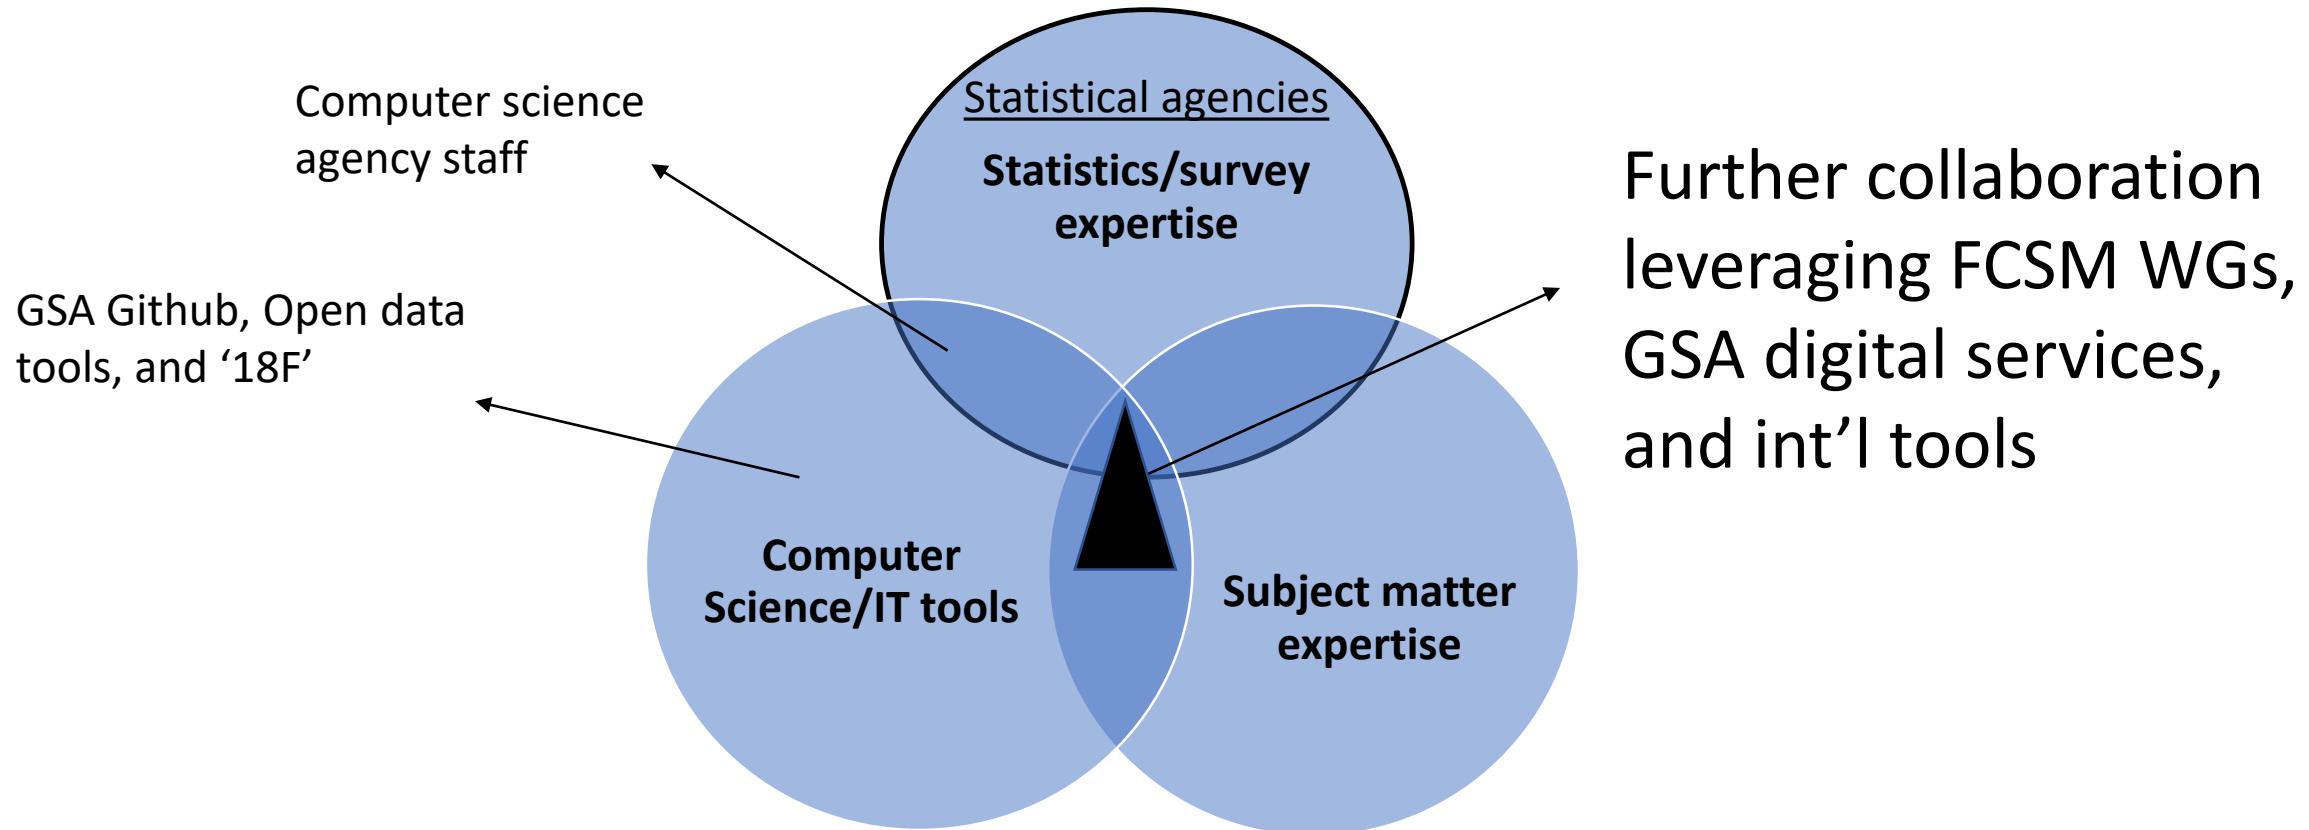

There are efforts to share metadata tools

But sometimes advances remain survey or agency specific.

Unexploited opportunities, for example, to increase re-use of metadata fields.

Opportunity: Facilitating inter-disciplinary collaboration (Data Science focus) to develop inter-operable metadata

Scenarios with possible outcomes building on this panel (post-panel)

Federal System-wide	NCSES-specific
<u>Near-term</u>	
Data APIs with some common metadata fields across agencies? (freq., unit of measurement, geographic labels)	Machine-readable data from Federal and other contractors?
Open metadata schema (data.gov) with enhanced fields for statistical data?	
<u>Long-term</u>	
Cross-agency metadata systems?	Metadata mgmt. system for selected domains (business, HR statistics)?
Directive on inter-operable metadata and metadata systems?	

Questions for the Panel on transparency and metadata quality

1. How agencies could better address *inter-disciplinary needs* to advance metadata quality?
2. Given complexity of metadata across agencies, only selected (cross-domain) metadata can be harmonized.
Which metadata should be considered as *starting points for metadata inter-operability*?
3. Which *domestic and international metadata tools and platforms* may be leveraged by NCSES and other agencies in the *near and long-term*?
