

# Macro Implications of Intangibles: Evidence from the UK

Jonathan Haskel

Queen Mary, University of London; CeRiBA, CEPR and IZA  
Funding from EU FP7, Project COINVEST

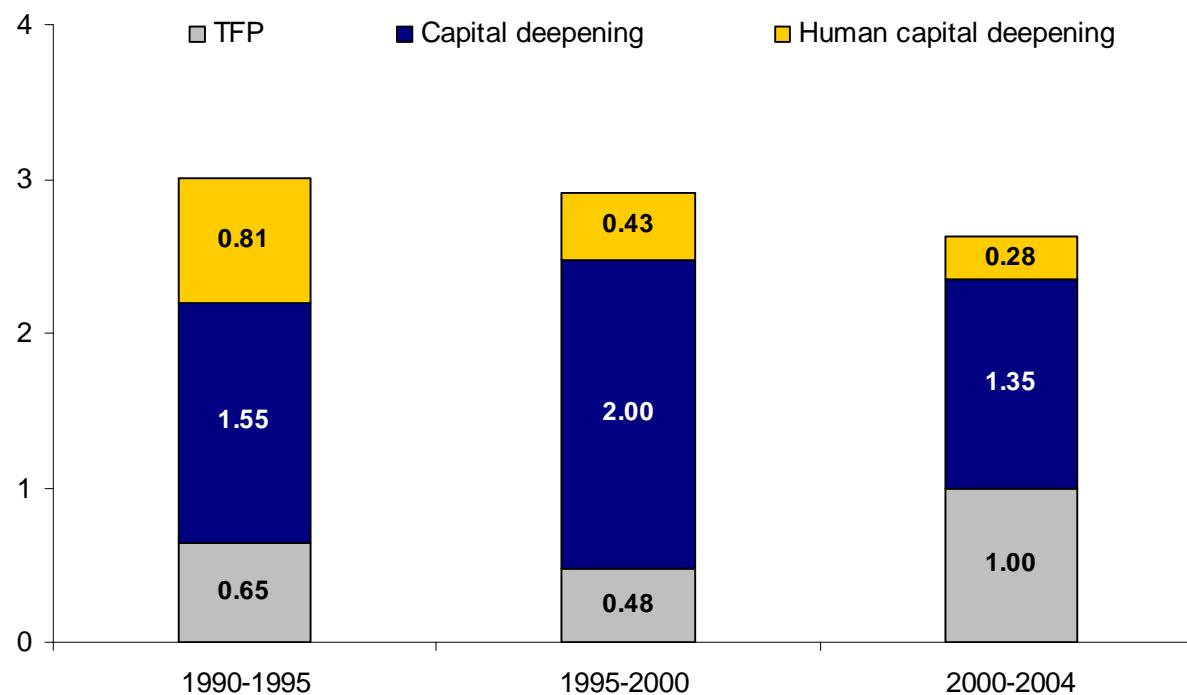

NAS/NSF/BEA/Congress Conference on Intangibles,  
Washington 23<sup>rd</sup> June 2008

# Background to UK work

- Where is the new economy?
  - Investment/GDP: flat since 1950s
  - $\pi$ /GDP: flat
  - LPG and TFPG falling
- Policy concerns
  - Lisbon agenda, make the EU "the most competitive and dynamic knowledge-driven economy by 2010" (EU, 2000).
  - Desire for a UK “innovation index”
- Outline of presentation
  - How adding intangibles to the UK data matters
  - Better data on intangible investments

# UK LPG/TFPG without intangibles

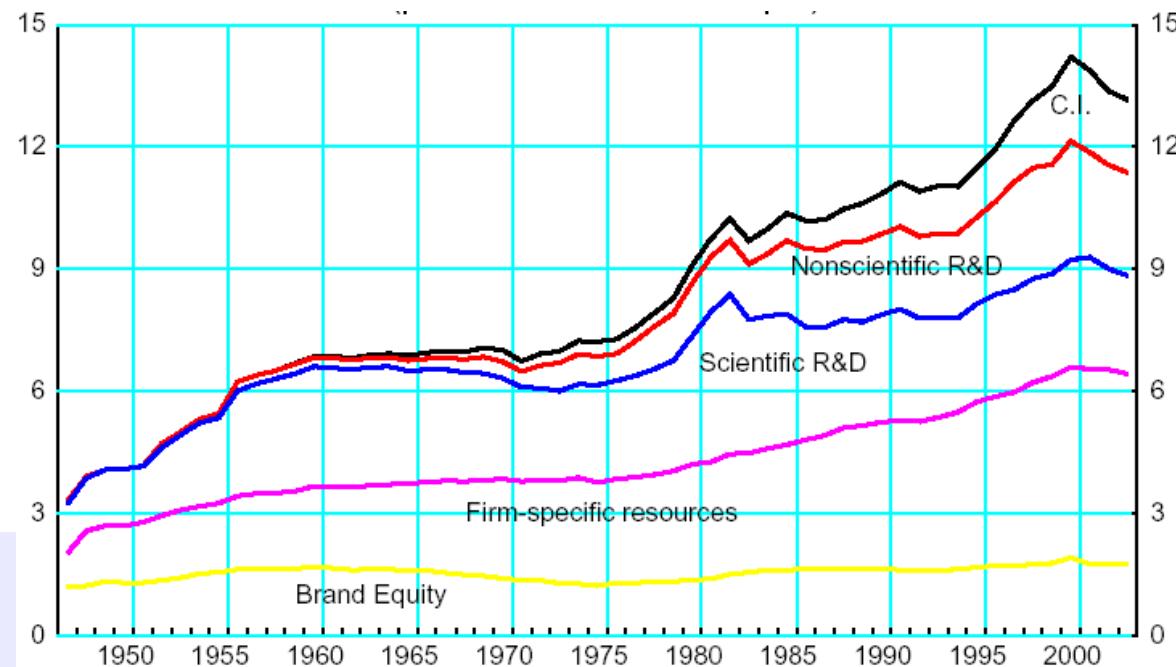

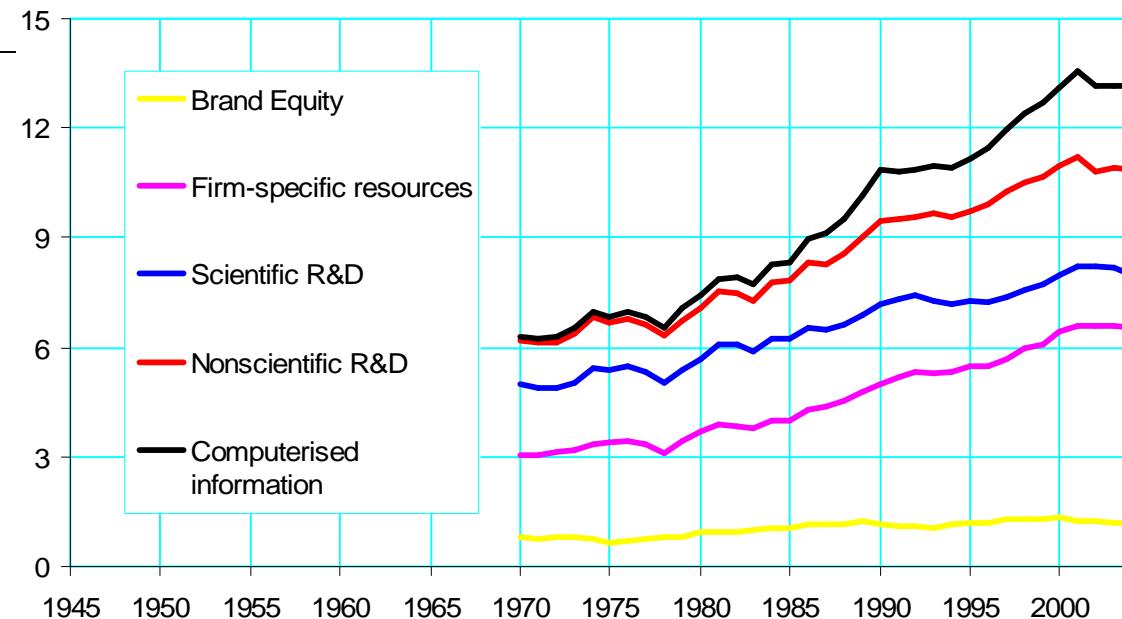

# UK work to explain poor prod'y perform

- Joint Fed, Bank of England project (Basu et al. (2004), Oulton and Srinivasan (2005))
- LPG and TFPG slowdown 1995-00.
  - Industry level, bottom up
  - Hours
  - Capital services not stocks
  - Capitalise software
- Finding: slowdown remains
- Question: can intangibles explain?

# UK intangibles and treatment mirrors US

| Type of intangible investment | Includes the following intangibles  | Current treatment in National Accounts |
|-------------------------------|---|--|
| Computerised information      | (1) Computer software<br>(2) Computer databases   | Both treated as investment             |
| Innovative property           | (1) Scientific R&D<br>(2) Mineral exploration<br>(3) Artistic originals<br>(4) New product development costs in the financial industry<br>(5) New architectural and engineering designs<br>(6) R&D in social science and humanities | Only (2) and (3) treated as investment |
| Economic competencies         | (1) Brand Equity<br>(2) Firm-specific human capital<br>(3) Organisational structure   | None of these treated as investment    |

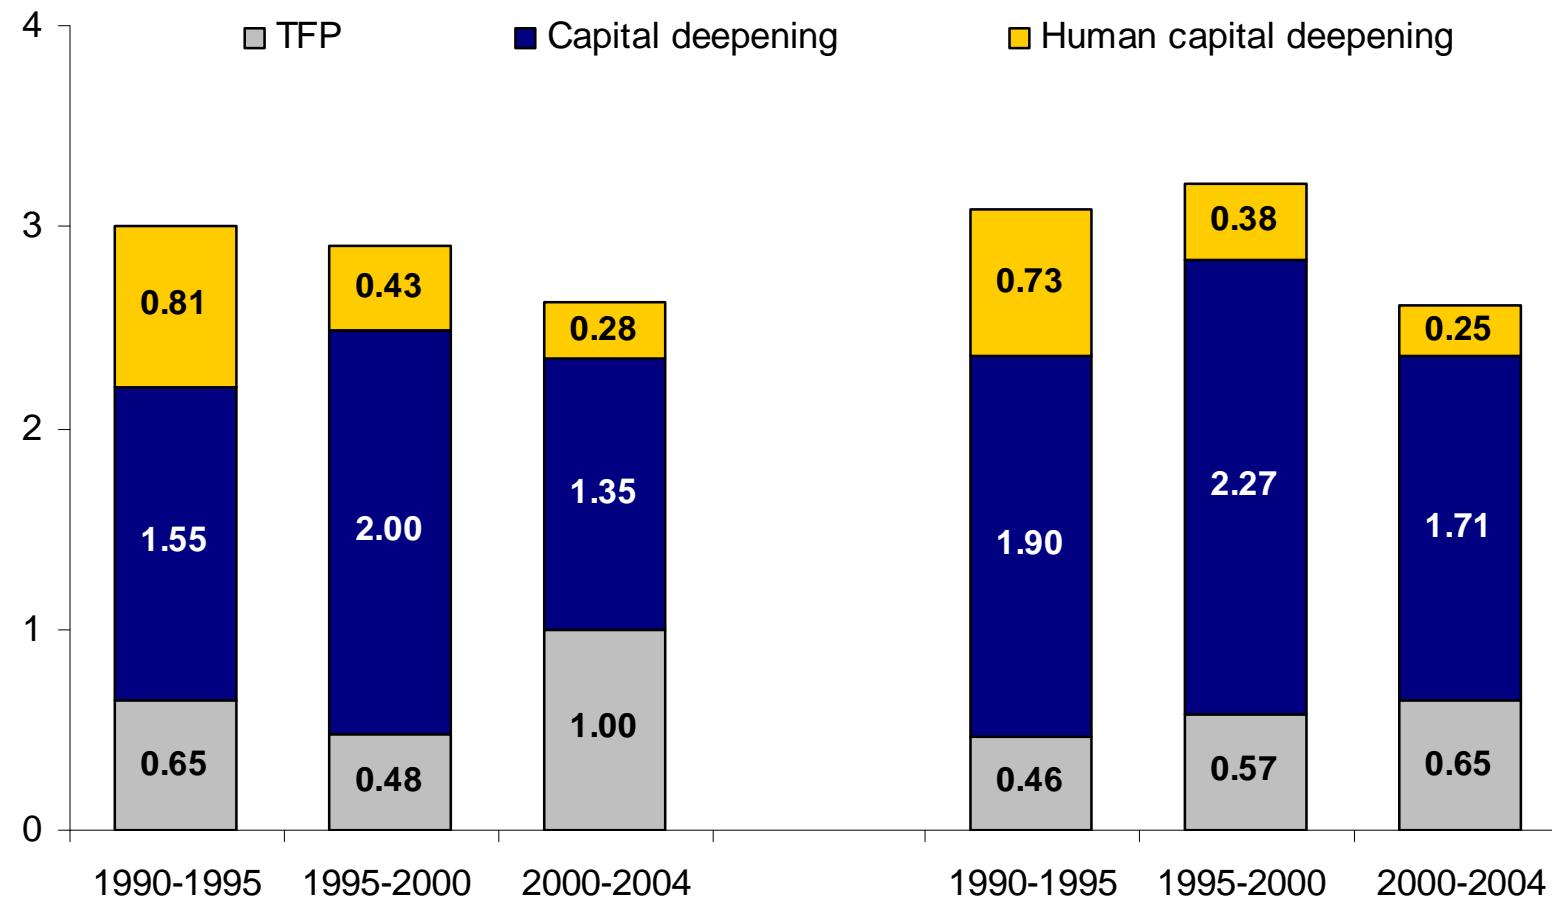

# Intangible investment by asset type, % of MGVA

# Growth accounting, outline

- Data on invest in intang
  - 1970-2006. Pre-1970 much interp
  - Training is X section
  - Own account for software
- Deflate and build real intang asset stocks
  - Mostly mkt-sector prices. US software. CHS deprec rates
- Recalculate GDP to include intang
- Build Hall/Jorgenson capital services
  - Rental rates ex post equal
- Labour quality adjustment
  - Ed'n, gender, age

# LPG/TFPG, market sector, without & with intan

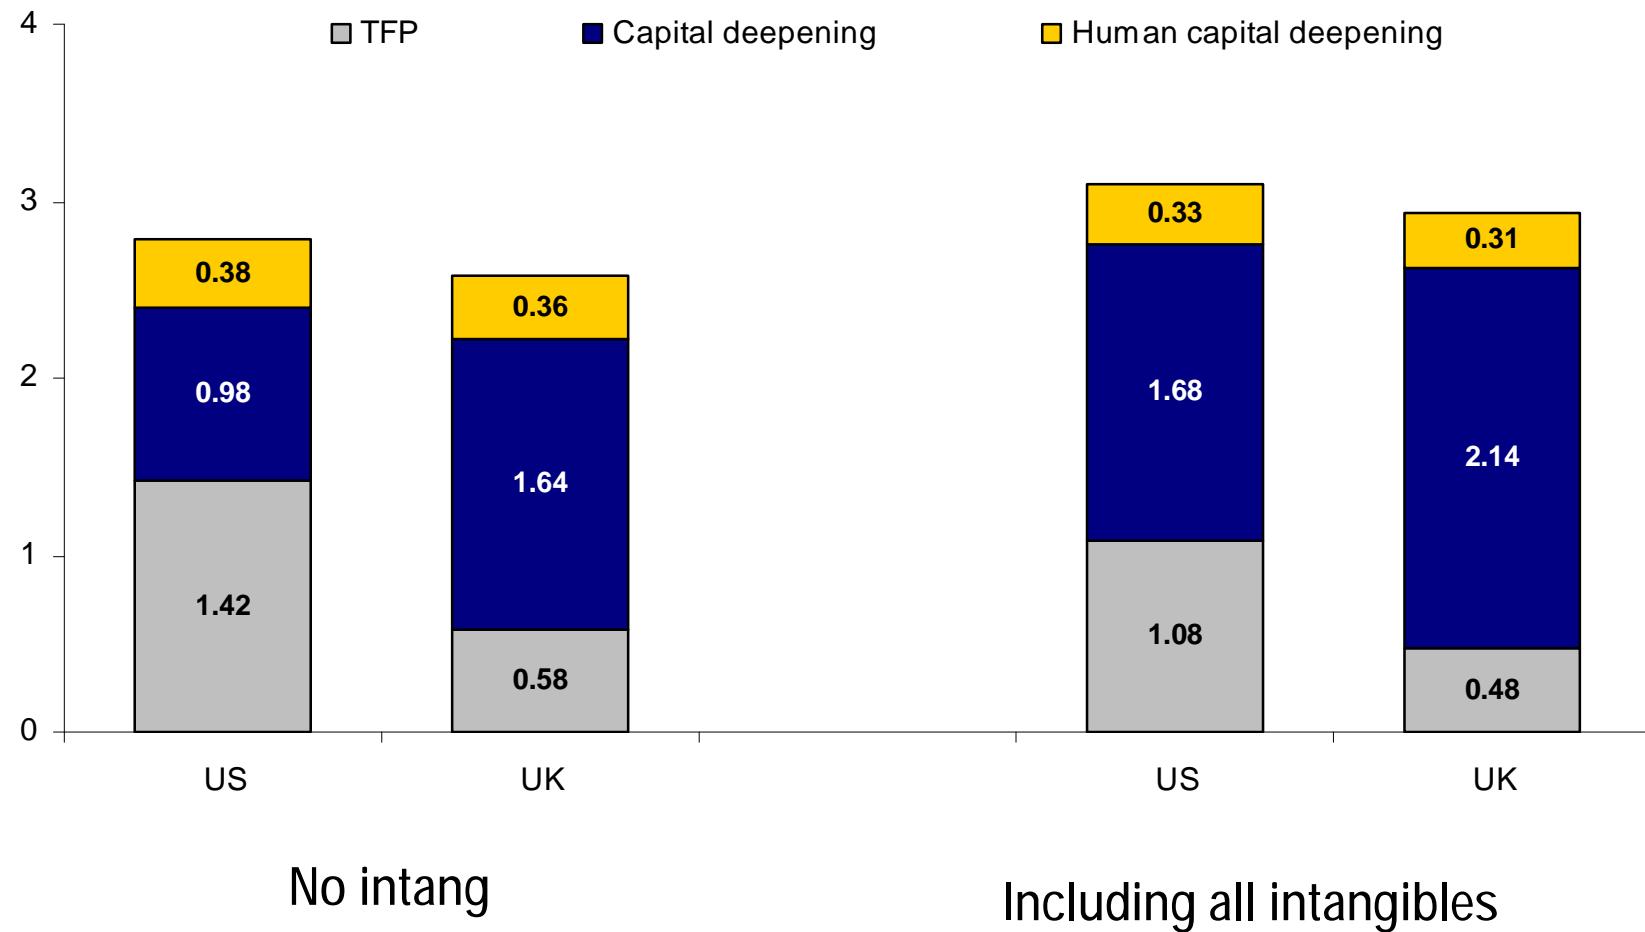

Existing National Accounts

Including all intangibles

CeRiBA

# US and UK LPG and TFPG with and without intangibles, 1995-2003

Contribution of Intangible Capital Deepening to the Annual Change in Labour Productivity, Nonfarm Business Sector (percentage points) (Market sector for UK). Percentage of tot intang capital deepening (US=0.84pppa, UK=0.60pppa)

|  | US<br>1995-2003<br>(1) | UK<br>1995-2003<br>(2) |
|--|------------------------|------------------------|
| <b>all intangibles, also those in the NA</b> |                        |                        |
| Intangible capital deepening                 |                        |                        |
| Computerized information                     | 32                     | 31                     |
| Innovative property                          | 26                     | 24                     |
| Scientific                                   | 10                     | 1                      |
| Nonscientific                                | 17                     | 24                     |
| Economic competencies                        | 42                     | 45                     |
| Brand equity                                 | 10                     | 6                      |
| Firm-specific resources                      | 32                     | 39                     |

# Better measuring intangibles and innovation: innovation surveys?

- EU “Community Innovation Survey”
- UK CIS = 12 pages
- If you had  $\frac{1}{2}$  page what would you ask?

# Structure of innovation surveys

1. Innovation. Did you innovate
  1. Yes, no
  2. fraction of sales
2. Spending on
  1. R&D, design, marketing, training
3. Information sources for innov'n (yes/no)
  1. joint ventures, clients, suppliers, trade fairs
4. Barriers to innovation what stopped you innovating?
  1. Cost
  2. Skilled labour
5. Other
  1. organisational change (1/0),
  2. public support received

# Priority of innovation survey questions

| Question   | Comment                                     |
|--|---|
| 1. Innovation. Did you innovate                        |   |
| Yes, no  | capital deepening                           |
| fraction of sales                                      | used by consultancies                       |
| 2. Spending on   |   |
| R&D, design, marketing, training                       | useful for intangibles                      |
| 3. Information sources for innov'n (yes/no)            |   |
| joint ventures, clients, suppliers, trade fairs        | interesting for academic study              |
| 4. Barriers to innovation what stopped you innovating? |   |
| Cost, skilled labour                                   | does not work due to identification problem |
| 5. Other   |   |
| 1. organisational change (1/0),                        | binary, no quantity                         |
| 2. public support received                             | binary, no quantity                         |

# Conclusions

- Intangibles
  - makes big difference for UK
  - considerable interest to construct innovation index
  - some innovation survey questions could be useful

# Extras

CeRiBA

# Agenda

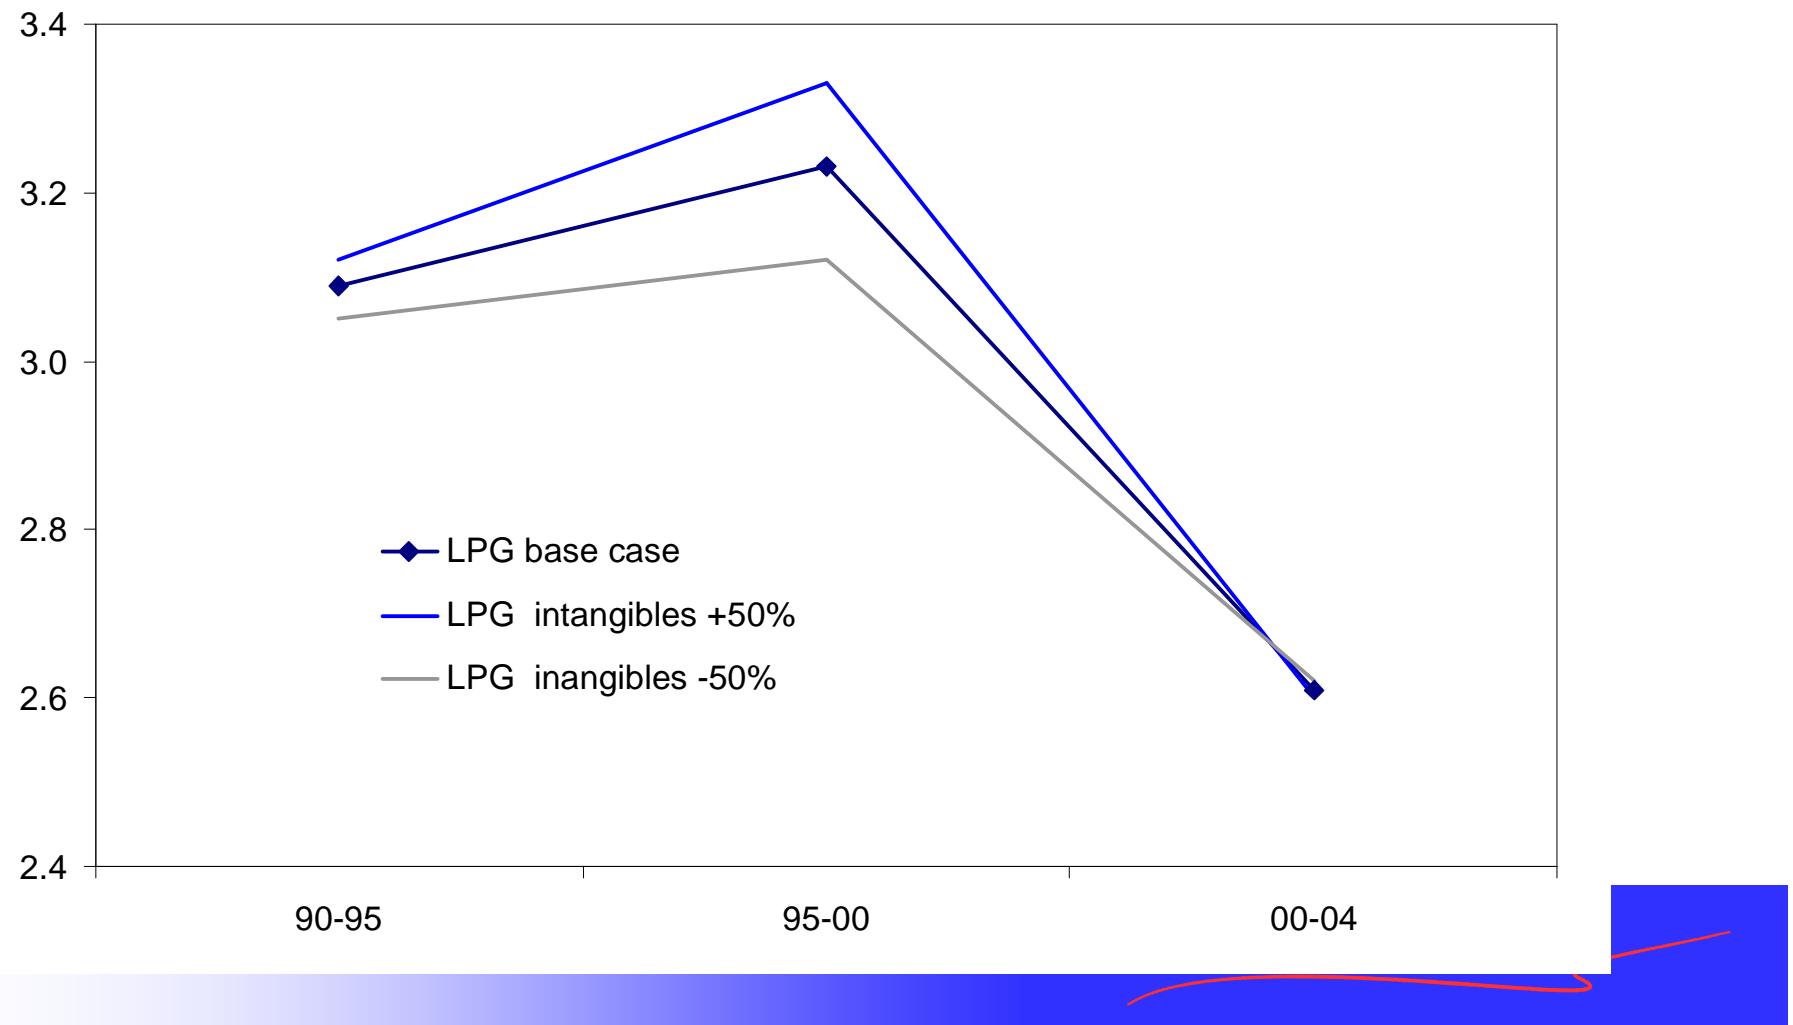

- Questions
  - Contribution of intang to GDP/productivity in UK
  - Significance of international flows
- UK answers
  - UK background: falling LPG, TFPG
  - Apply CHS method
  - Main findings
    - Investment
      - X-section: £ of intang= £ of tang (2004)
      - Time series: 1970: intang I/Market GDP=7%, 2004= 14%
    - Prod growth
      - 1990s: rising LPG and TFPG
      - 2000s: falling LPG, rising TFPG

# Sensitivity tests

- Vary depreciation rates
- Vary price deflators

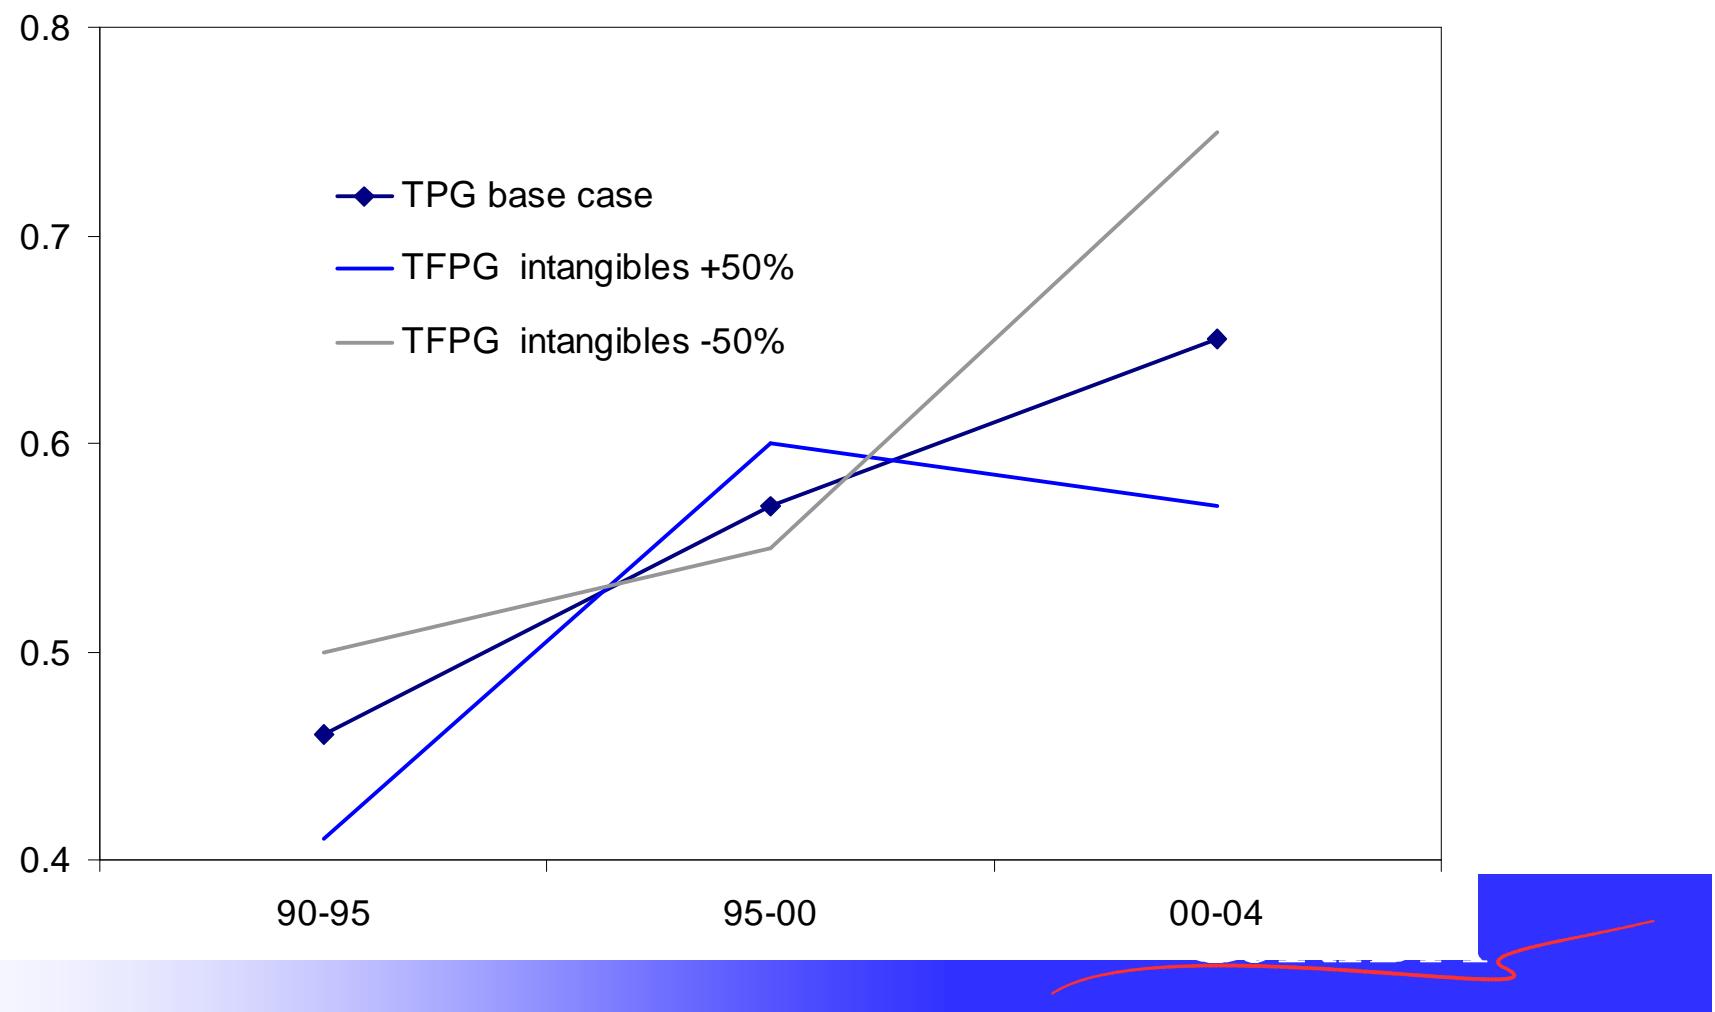

# Sensitivity of LPG

Intangible investment increased and decreased by 50 % for uncertain items (R&D, fin and arc, market research, organisational structure)

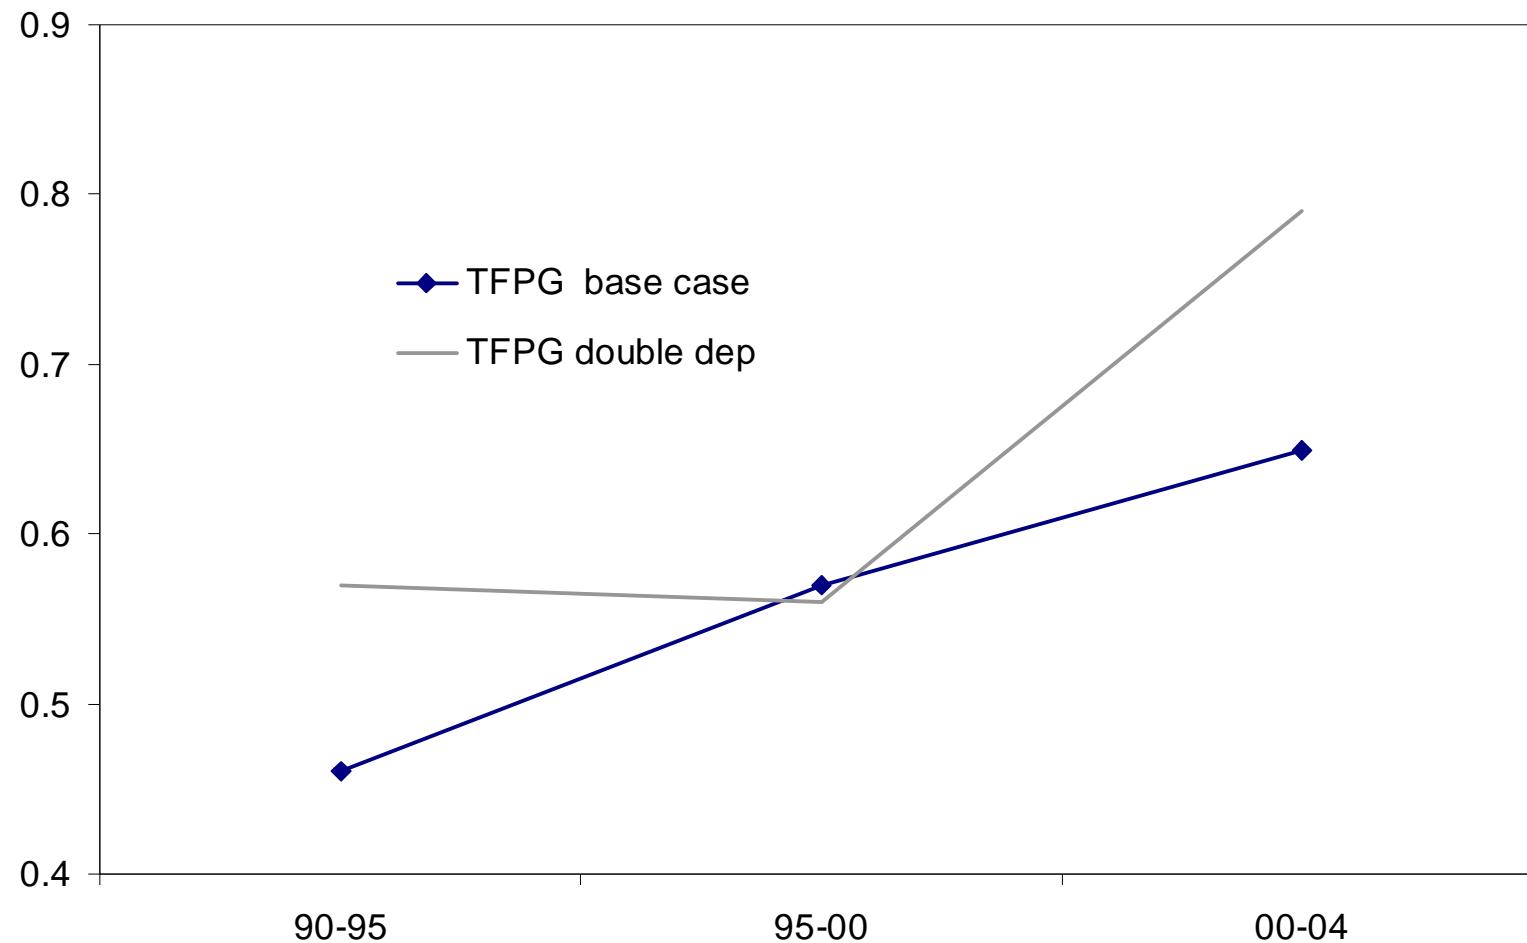

# Sensitivity of TFPG

Intangible investment increased and decreased by 50 % for uncertain items (R&D, fin and arc, market research, organisational structure)

# Sensitivity of TFPG

Double depreciation rates for intangibles

# Summary of findings on the UK puzzles

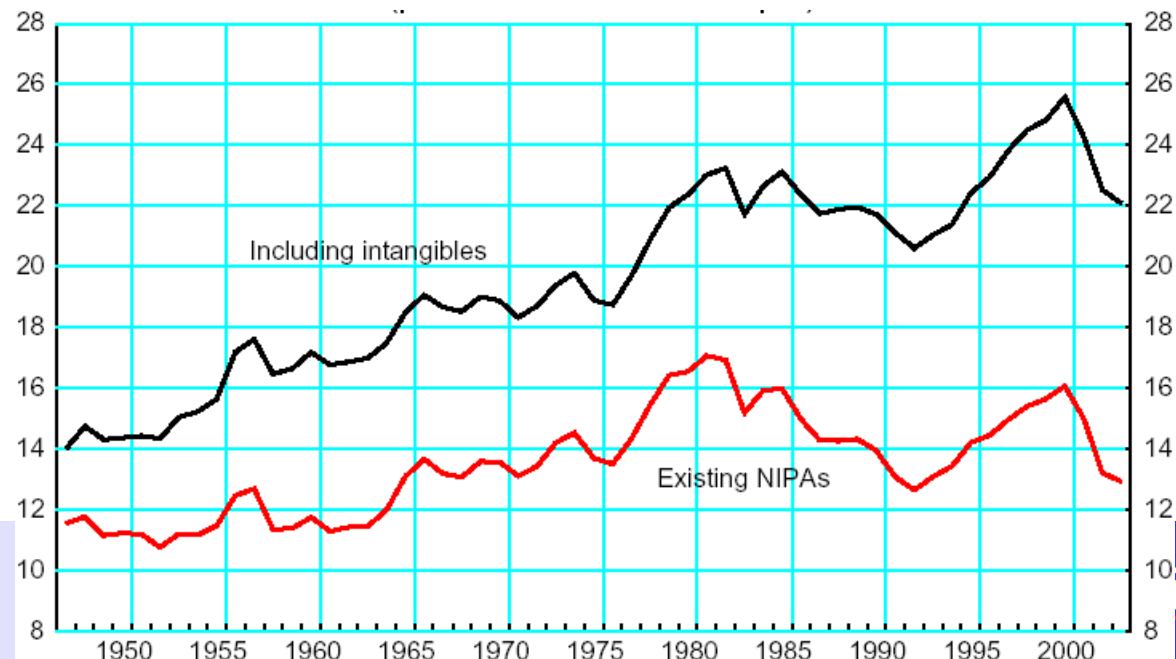

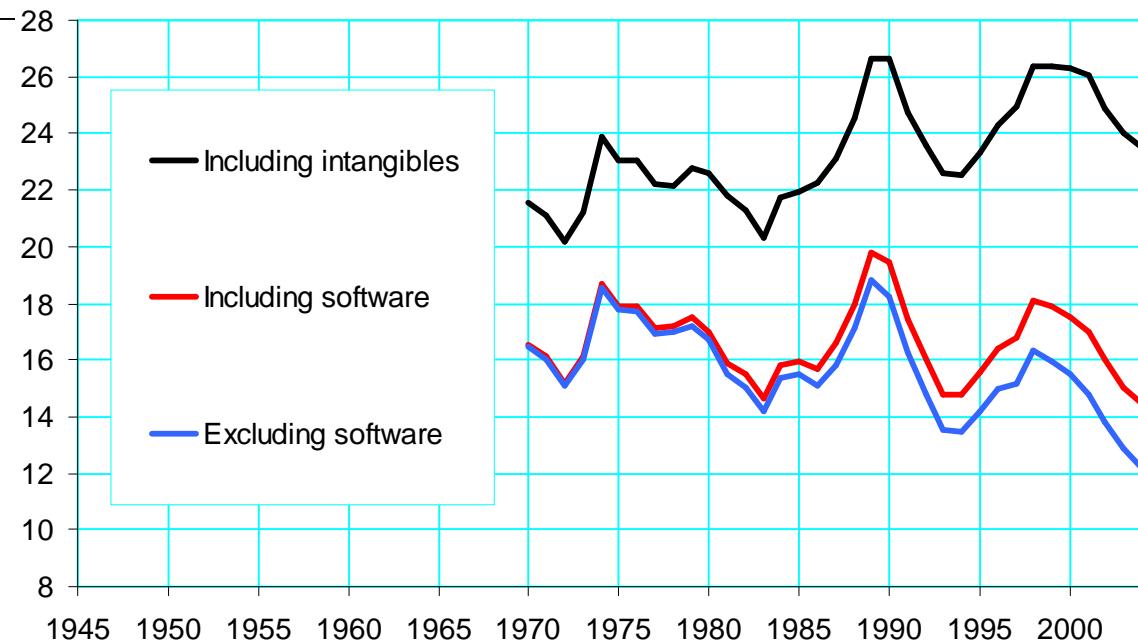

1. Investment in new technologies: but  $I/Y$  falling  
*With intang,  $I/Y$  rises*
2. Returns to that investment: but  $\pi/Y$  constant  
*With intang,  $\pi/Y$  rises*
3. Productivity gains: but LPG and TFPG fell after 1995  
*With intang, LPG and TFPG both rise*

# Effect of the intangibles: UK vs US

|                                  | US            | UK            |
|----------------------------------|---------------|---------------|
|                                  | 1995-<br>2003 | 1995-<br>2003 |
| <b>excluding software</b>        |               |               |
|                                  | (1)           | (2)           |
| Labour productivity growth       | 2.78          | 2.59          |
| Capital deepening                | 0.98          | 1.64          |
| Human capital deepening          | 0.38          | 0.36          |
| TFP growth                       | 1.42          | 0.58          |
|                                  | US            | UK            |
|                                  | 1995-<br>2003 | 1995-<br>2003 |
| <b>including software</b>        |               |               |
|                                  | (1)           | (2)           |
| Labour productivity growth       | 2.95          | 2.73          |
| Capital deepening                | 1.26          | 1.82          |
| Human capital deepening          | 0.37          | 0.35          |
| TFP growth                       | 1.32          | 0.56          |
|                                  | US            | UK            |
