Blueprint for American Prosperity
Unleashing the Potential of a Metropolitan Nation

Shrinking the Carbon Footprint of Metropolitan America

Marilyn A. Brown, Frank Southworth, and Andrea Scazzini

America's carbon footprint is expanding. With a growing population and an expanding economy, America's settlement area is widening, and as it does, Americans are driving more, building more, consuming more energy and emitting more carbon. Rising energy prices, growing dependence on imported fuels, and accelerating global climate change make the nation's growth patterns unsustainable.

Metropolitan America is poised to play a leadership role in addressing these energy and environmental challenges. However, federal policy actions are needed to achieve the full potential of metropolitan energy and climate solutions.

America's Challenge

The nation's carbon footprint has a distinct geography not well understood or often discussed. This report quantifies transportation and residential carbon emissions for the 100 largest U.S. metropolitan areas, finding that metro areas on average have smaller carbon footprints than the average American. However, metro footprints vary widely. Population density and the availability of public transit are important to understanding carbon footprints, as are the carbon intensity of electricity generation, electricity prices, and weather.

Limitations of Existing Federal Policy

Numerous market and policy distortions inhibit metropolitan action from more aggressively addressing the nation's climate challenge. Economy-wide problems include underpriced energy, underfunded energy research, misleading national statements, distorted utility regulations, and inaccurate information. Policy impediments include a tax system that penalizes transit, inadequate federal leadership on freight and land-use planning, failure to encourage energy-

and location-efficient housing decisions, and the fragmentation of federal transportation, housing, energy, and environmental policies.

A New Federal Approach

Federal policy could play a powerful role in helping metro areas and so the nation shrink their carbon footprint. In addition to economy-wide policies to motivate action, the targeted policies are particularly important within metro areas and for the nation as a whole.

Promote more transportation choices to expand transit and compact development options.

Introduce more energy-efficient freight operations with regional freight planning.

Require more energy cost disclosure when selling and "renting" housing to stimulate and scale up energy-efficient retrofitting of residential housing.

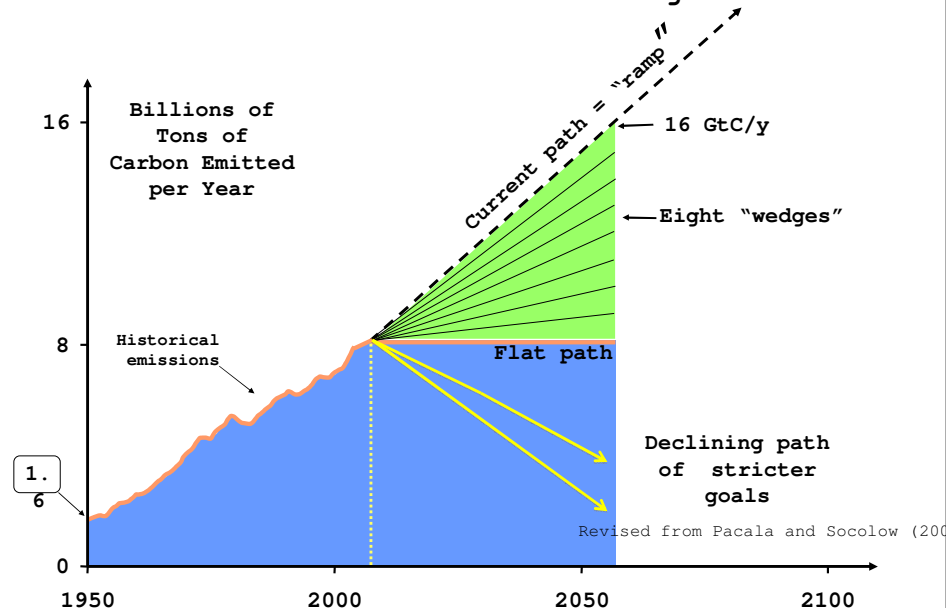

Use federal housing policy to create incentives for energy and location-efficient decisions.

Make a metropolitan challenge to develop innovative solutions that integrate multiple policy areas.

Calibrating the Climate Challenge with Global "Stabilization Wedges"

The U.S. Needs to Set a Cumulative GHG Emissions Budget

The National Academies report
- "Limiting the Magnitude of Climate Change" - offers a representative range of 170-200 gigatons (Gt) of CO₂-eq for 2012-2050.

Business-as-usual emissions would consume these budgets

well before 2050; thus, the case for URGENCY.

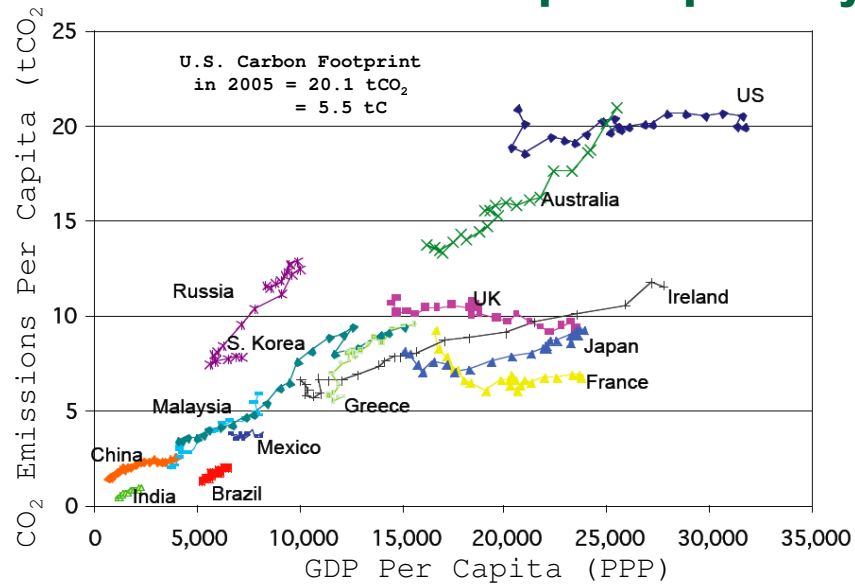

The emissions of the rich eventually must equal the emissions of today's poor

National carbon footprints illustrate the need for alternative development pathways

Sources: Steve Koonin, BP (2007): IEA, 2007, Key World Energy Statistics.

Cities can be part of the solution: they offer the potential for great energy and carbon efficiencies

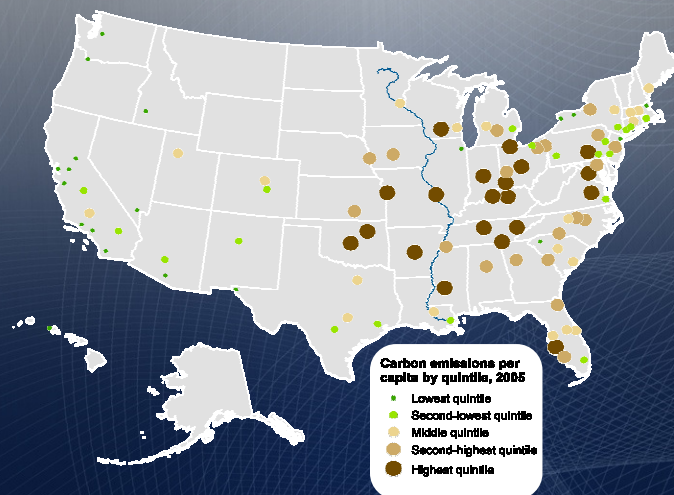

Percentage of national activity in 100 largest metro areas, 2005

Per capita emissions vary substantially, illuminating what works and what doesn't

<i>Largest per capita carbon footprints, 2005</i>	<i>Tons of carbon per capita</i>	<i>Smallest per capita carbon footprints, 2005</i>	<i>Tons of carbon per capita</i>
Lexington, KY	3.455	Honolulu, HI	1.356
Indianapolis, IN	3.364	Los Angeles, CA	1.413
Cincinnati, OH	3.281	Portland, OR	1.446
Toledo, OH	3.240	New York, NY	1.495
Louisville, KY	3.233	Boise City, ID	1.507
Nashville, TN	3.222	Seattle, WA	1.556
St. Louis, MO	3.217	San Jose, CA	1.573
Oklahoma City, OK	3.204	San Francisco, CA	1.585
Harrisburg, PA	3.190	El Paso, TX	1.613
Knoxville, TN	3.134	San Diego, CA	1.630

The Mississippi River roughly divides the country into high and low emitting metropolitan areas

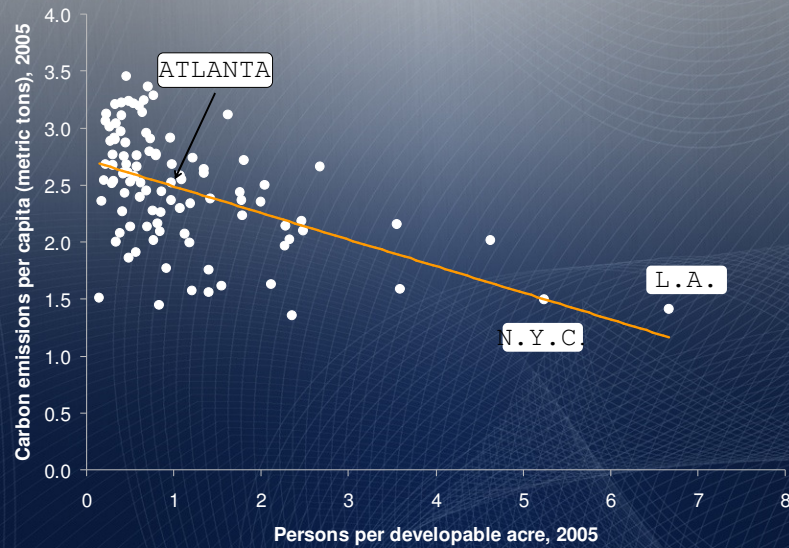

Fuel mix and electricity prices are important determinants of emissions

- The fuel mix used to generate electricity matters in residential footprints
- Lower electricity prices are correlated with larger residential footprints
- Areas with lower residential building carbon footprints tend to be located in mild climates with low heating and cooling requirements

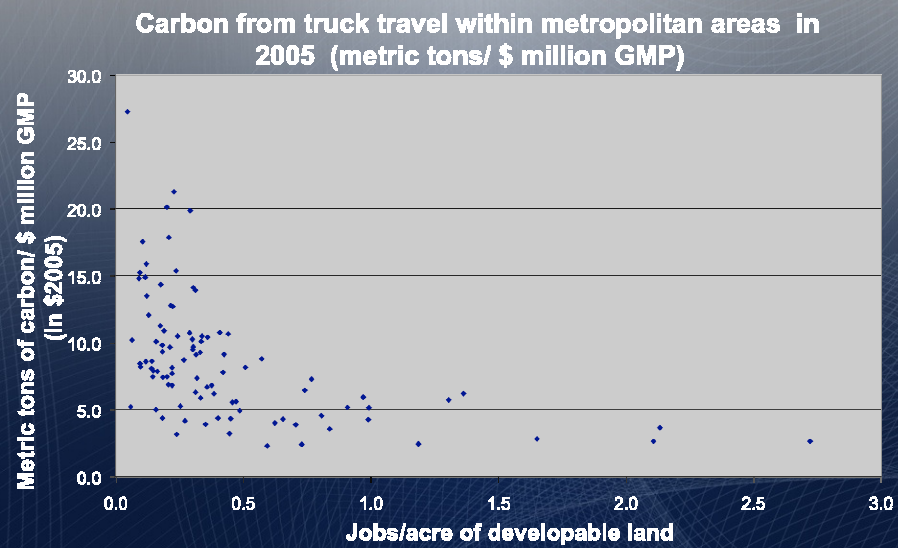

Development patterns and rail transit play an important role in determining carbon emissions

- Density and concentration of development tend to be higher in the lowest-emitting metro areas
- Many metro areas with small per capita carbon footprints also have sizeable rail transit ridership
- Dispersed employment causes high car and truck carbon emissions

Denser metro areas tend to have lower per capita carbon footprints

persed Employment Increases Truck Emissi

Sustainable, Resilient Transportation

- Transportation effect of densification

- Integration across infrastructures (electric vehicles, built environment design)

The Benefits of Infrastructure Ecology

- Reorganizing the linkage among individual infrastructure systems is like changing food chains in ecology.
- Co-locating power production and productive uses of heat can double resource efficiencies and cut pollution in half.
- This **infrastructure ecology** has a high potential to significantly contribute to solving the gigaton problems.

State Building Codes: A Chaotic Policy Landscape

Map of the United States showing the number of states with a specific number of representatives in the House of Representatives. The map is color-coded: green for 1 representative, orange for 2 representatives, and white for 3 representatives. The states are labeled with their abbreviations and the number of representatives they have. A legend on the right lists the number of representatives for each state.

Water for Energy in the U.S.: A Co-Benefit of Saving Electricity

- Thermoelectric power generation accounts for approximately 39% of total freshwater consumption and 52% of fresh surface water withdrawals..
- The average (weighted) evaporative consumption of water for power generation over all sectors is around 2.0 Gal/kWh.

US Freshwater withdrawals by
sector
(Total withdrawal: 345

Energy Source	Gal/kWh (Water Consumption)
Hydro	18.27
Nuclear	0.62
Coal	0.49
Oil	0.43
PV Solar	0.030
Wind	0.001

Historic Energy/Environment Regulatory Focus on Industry

- Since the explosion of environmental regulation in the early 1970s, policymakers have focused most regulatory prescriptions on large industrial sources.
- Thus, controlling emissions from cars = adoption of fuel economy standards for manufacturers.
- Controlling emissions from residential electricity use = regulating the building industry + rate reform for utilities.

Yet Consumers are Increasingly the Driving Force of Domestic Energy/Carbon

- Schipper, et al. (1989) = 45-55% of energy use
- Vandenergh and Steinemann (2007) = 32% of carbon emissions
- Bin and Bin, S. and H. Dowlatabadi (2005) = More than 80% of the energy used and the CO₂ emitted in the U.S. are a consequence of consumer demands and the economic activities to support these demands.

The Behavioral Wedge

“Household Actions Can Provide a Behavioral Wedge to Rapidly Reduce U.S. Carbon Emissions”

Dietz, T., G. T. Gardner, J. Gilligan, P. C. Stern, and M. P. Vandenbergh. 2009. *Proceedings of the National Academy of Sciences*. <http://www.pnas.org/content/106/44/18452>.

17 types of household actions can reduce energy consumption with available technology, low cost, and without appreciable lifestyle changes.

Grounds for Optimism

- Carbon emissions are just beginning to be priced – “market signals” will spur innovation.
 - Most of the 2050 physical plant is not yet built – with growth comes opportunity.
 - Our urban energy systems could be made much more efficient – reducing emissions and creating jobs.
- ✓ Can barriers be overcome and behavior be changed at
