

# Landscape Conservation Cooperatives

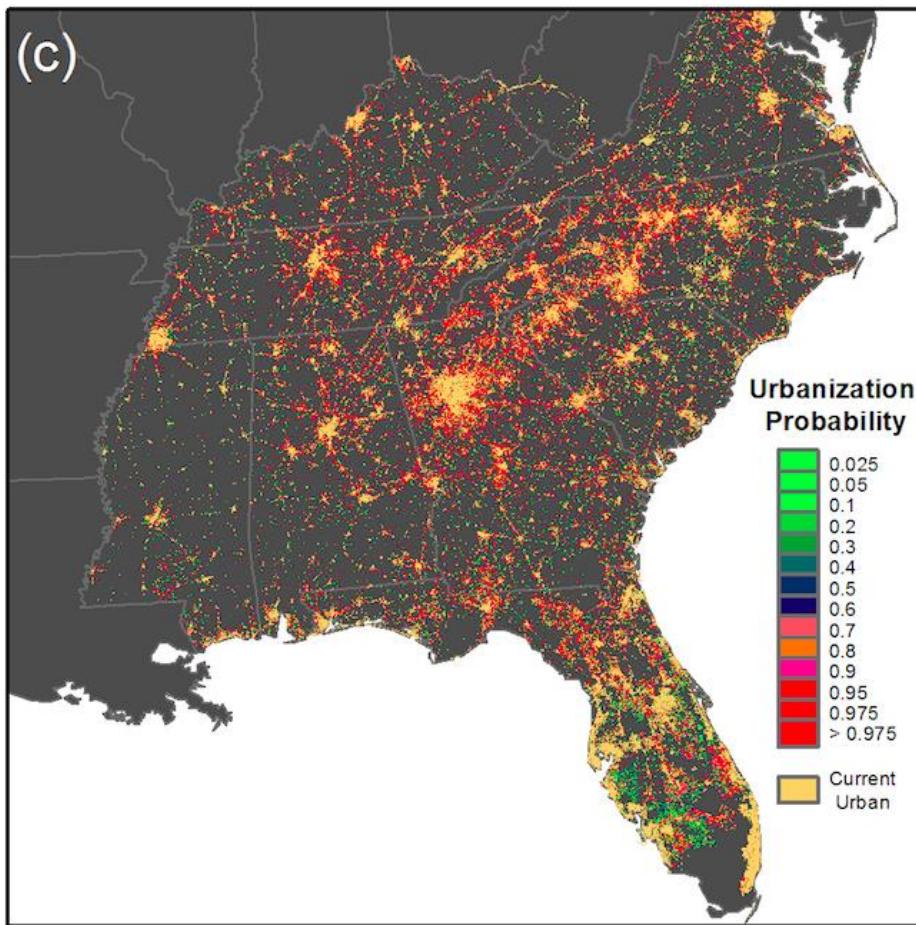

[lccnetwork.org](http://lccnetwork.org)

# Questions to cover

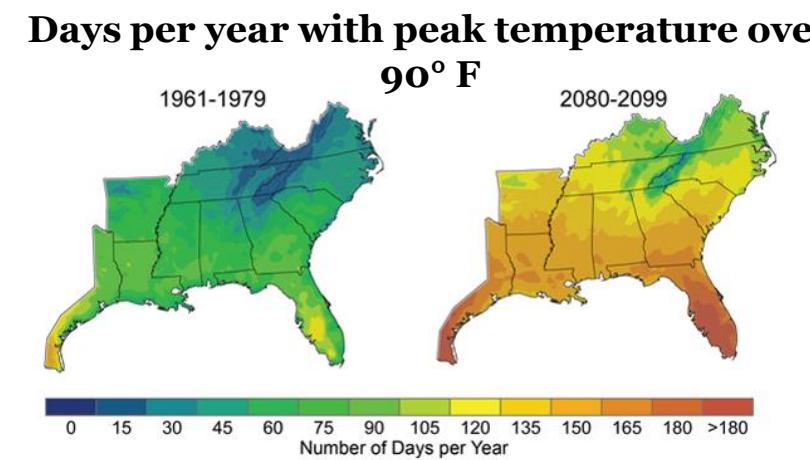

- How can multi-resource analysis be defined and integrated into a practical, overarching landscape-based framework to guide decision making?
- What key relationships among natural resources need to be incorporated into these assessments, and what social, economic, and environmental impacts are most relevant?
- What datasets are needed to conduct an integrated landscape and/or multi-resource analysis?

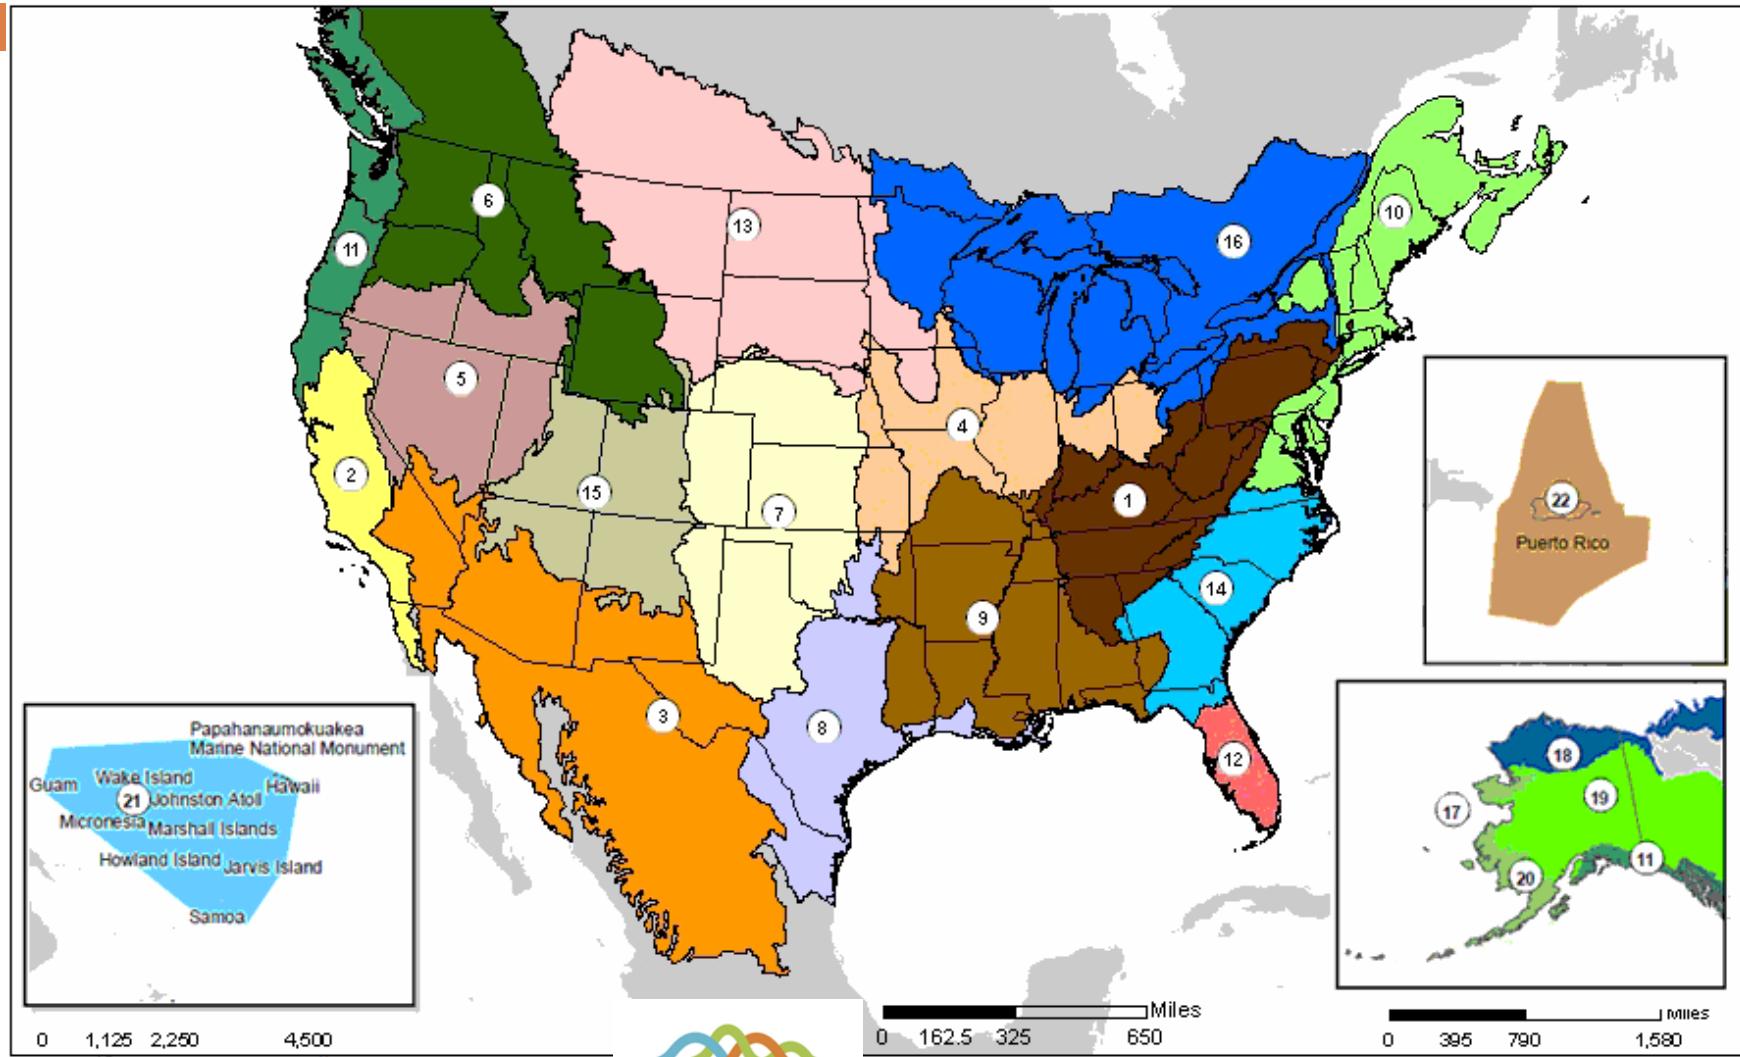

# Why cooperate?

**Days per year with peak temperature over 90° F**

# Landscapes Capable of Sustaining Natural and Cultural Resources for Current and Future Generations

LANDSCAPE CONSERVATION  
COOPERATIVES

# Involvement in the LCCs

## 270+ Agencies and Organizations

- All 50 state natural resource agencies
  - States serve as Chairs (or Vice Chairs) on ~2/3 LCC Steering Committees
- All major federal resource management and conservation agencies
  - FWS, BLM, BOR, NPS, USGS, BIA, BOEM
  - USFS, NRCS, FSA, NOAA/NMFS, EPA, USACE, DOE, DOD, TVA
- Tribes: 20+ individual and consolidated groups
- NGOs, Partnerships (JVs, FHPs), Academic: 40+
- Climate Science Centers, NOAA RISAs, Climate Hubs

# Landscape Conservation Cooperatives: Strategic Goals

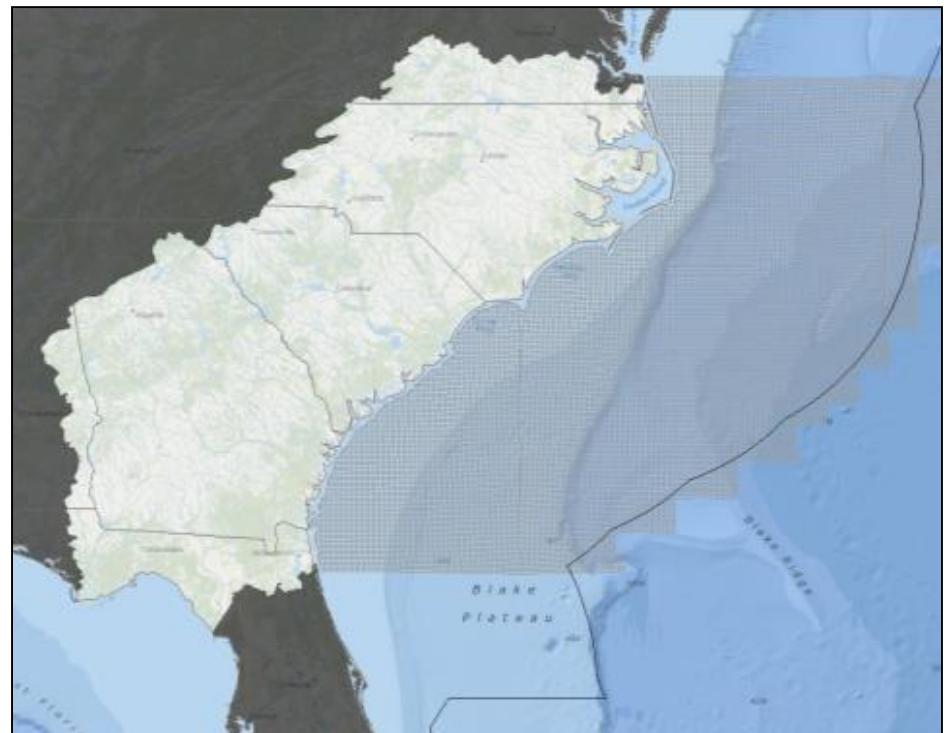

- A network of landscapes and seascapes adaptable to global change
- Facilitated alignment of partnership needs and resources
- Conservation of natural and cultural resources guided by collaborative application of science, experience, and cultural and traditional ecological knowledge
- Advance the knowledge of, support for, and engagement in landscape-scale conservation

How can multi-resource analysis be defined and integrated into a practical, overarching landscape-based framework to guide decision making?

# South Atlantic LCC

**Mission:** Create a shared **blueprint** for landscape conservation actions that sustain natural and cultural resources

# Indicators and targets

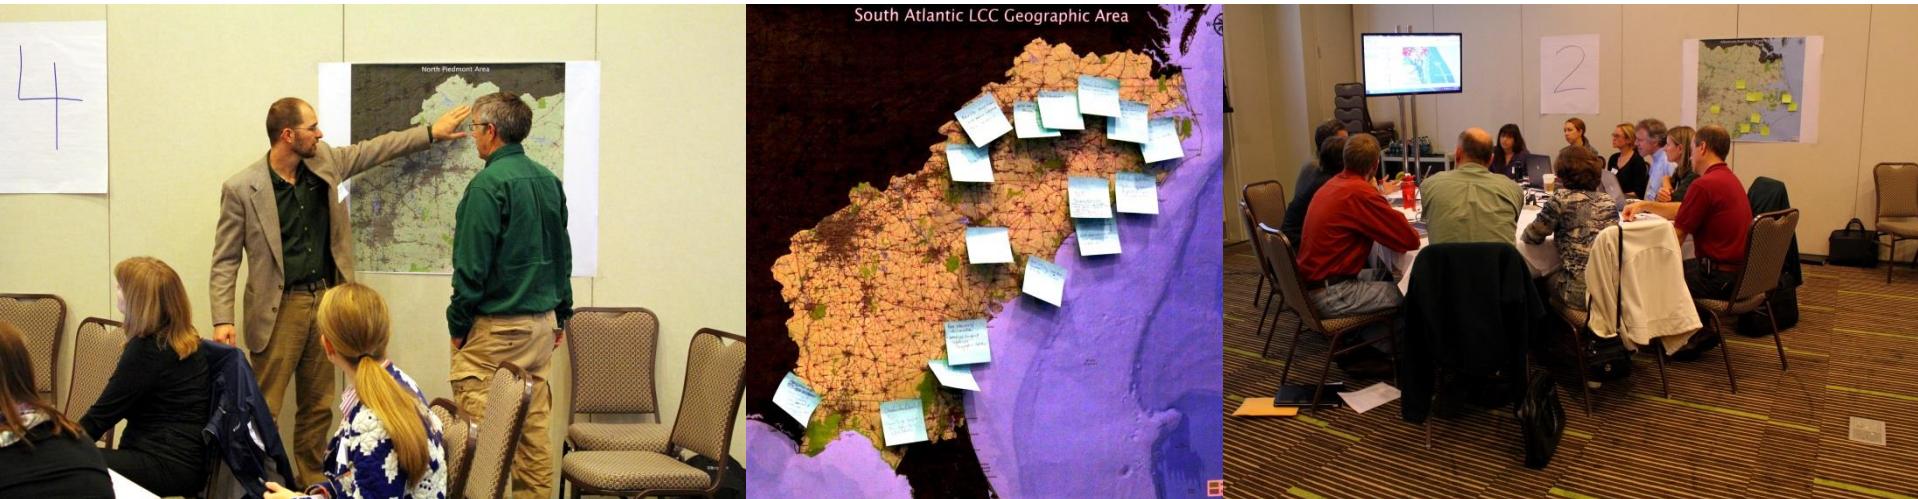

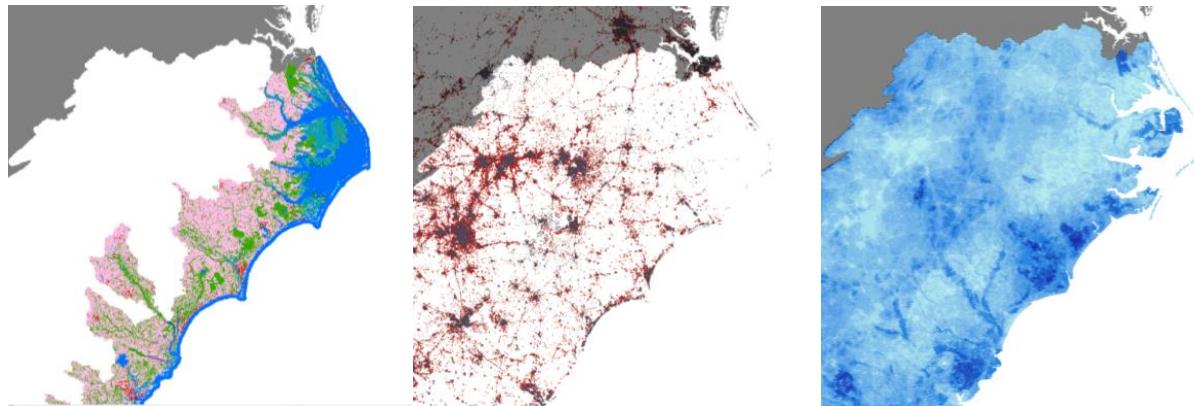

## □ Ecosystem integrity

## □ Intact cultural landscapes

# Southeast Conservation Adaptation Strategy (SECAS)

## SECAS Conservation Blueprint 2060: Work in Progress

What key relationships among natural resources  
need to be incorporated into these assessments,  
and what social, economic, and environmental  
impacts are most relevant?

# Key relationships and impacts

- Depends on scale:
  - of objective to be achieved on the landscape
  - of landscape
- Depends on communities and partners involved

# Ongoing case study

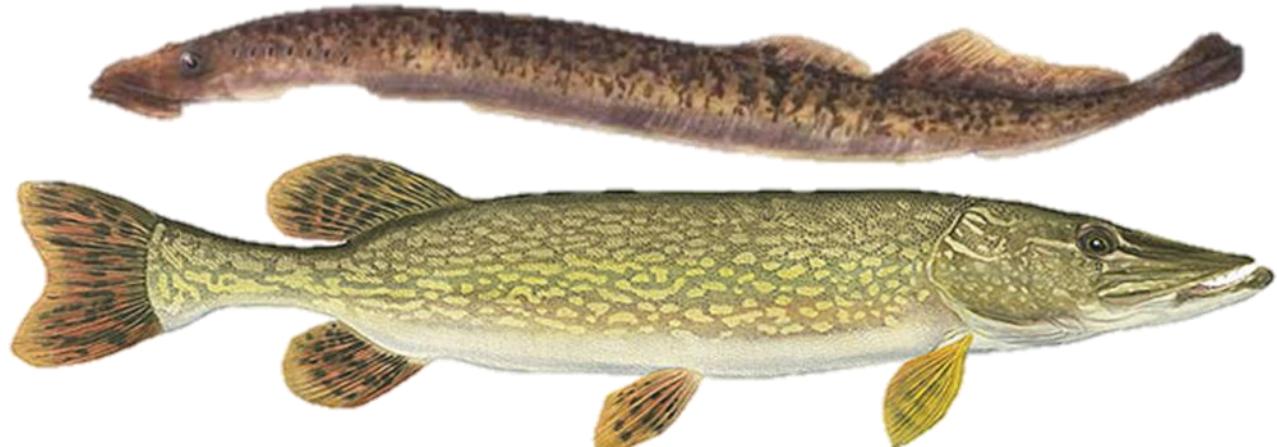

- The Upper Midwest & Great Lakes Landscape Conservation Cooperative restoring the connectivity between the Great Lakes and their tributaries

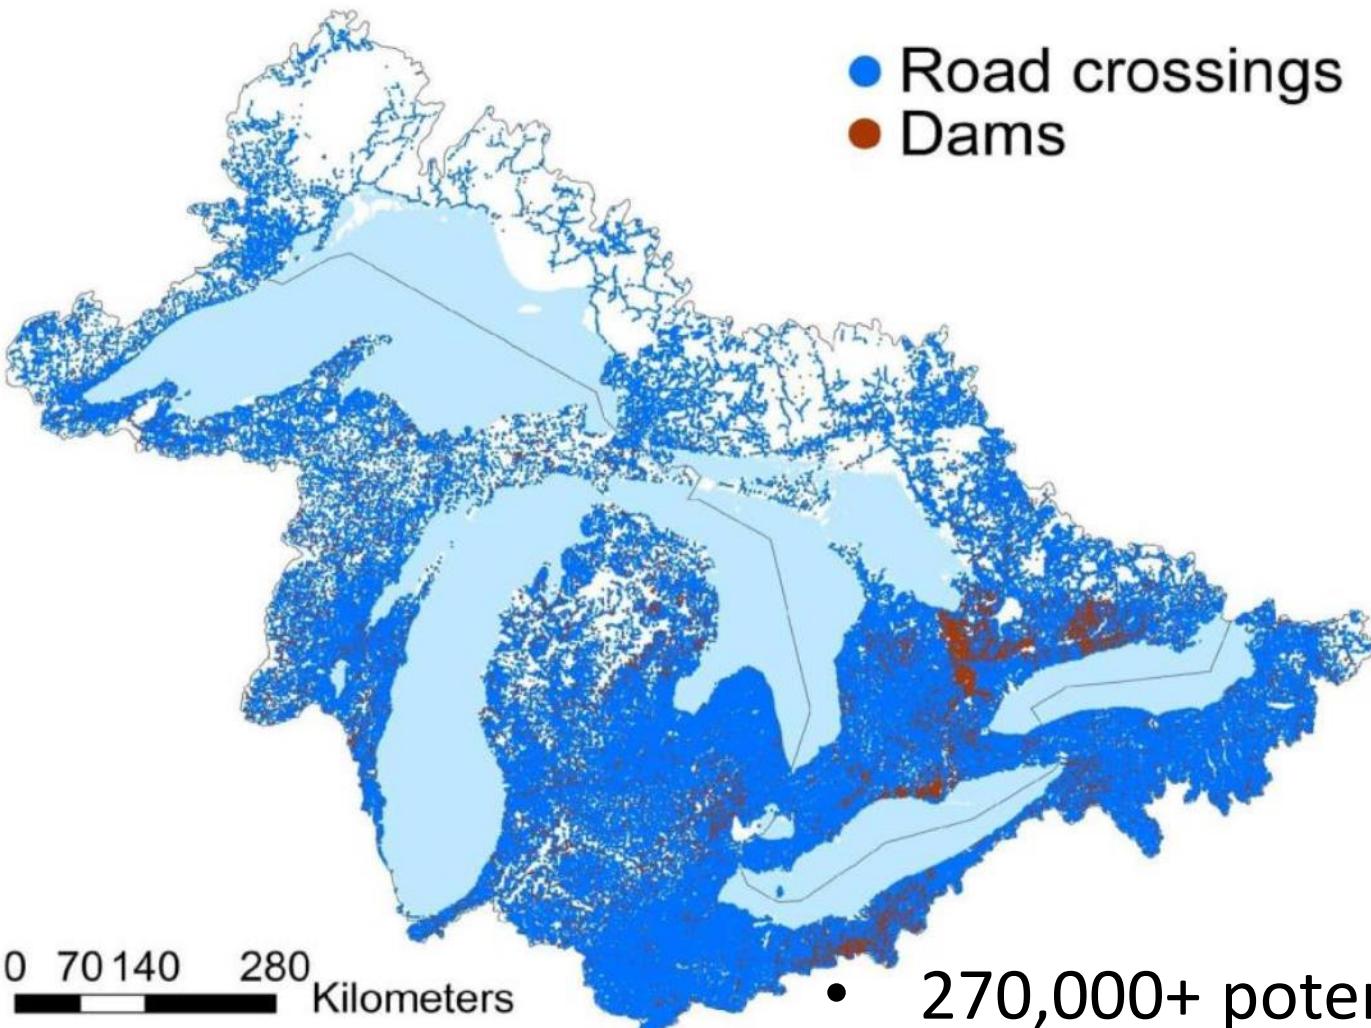

# Challenge identification

- Upper Midwest & Great Lakes LCC steering committee
- Issue – barrier removal vs. retention
  - Challenge facing nearly all conservation organizations around the Great Lakes basin

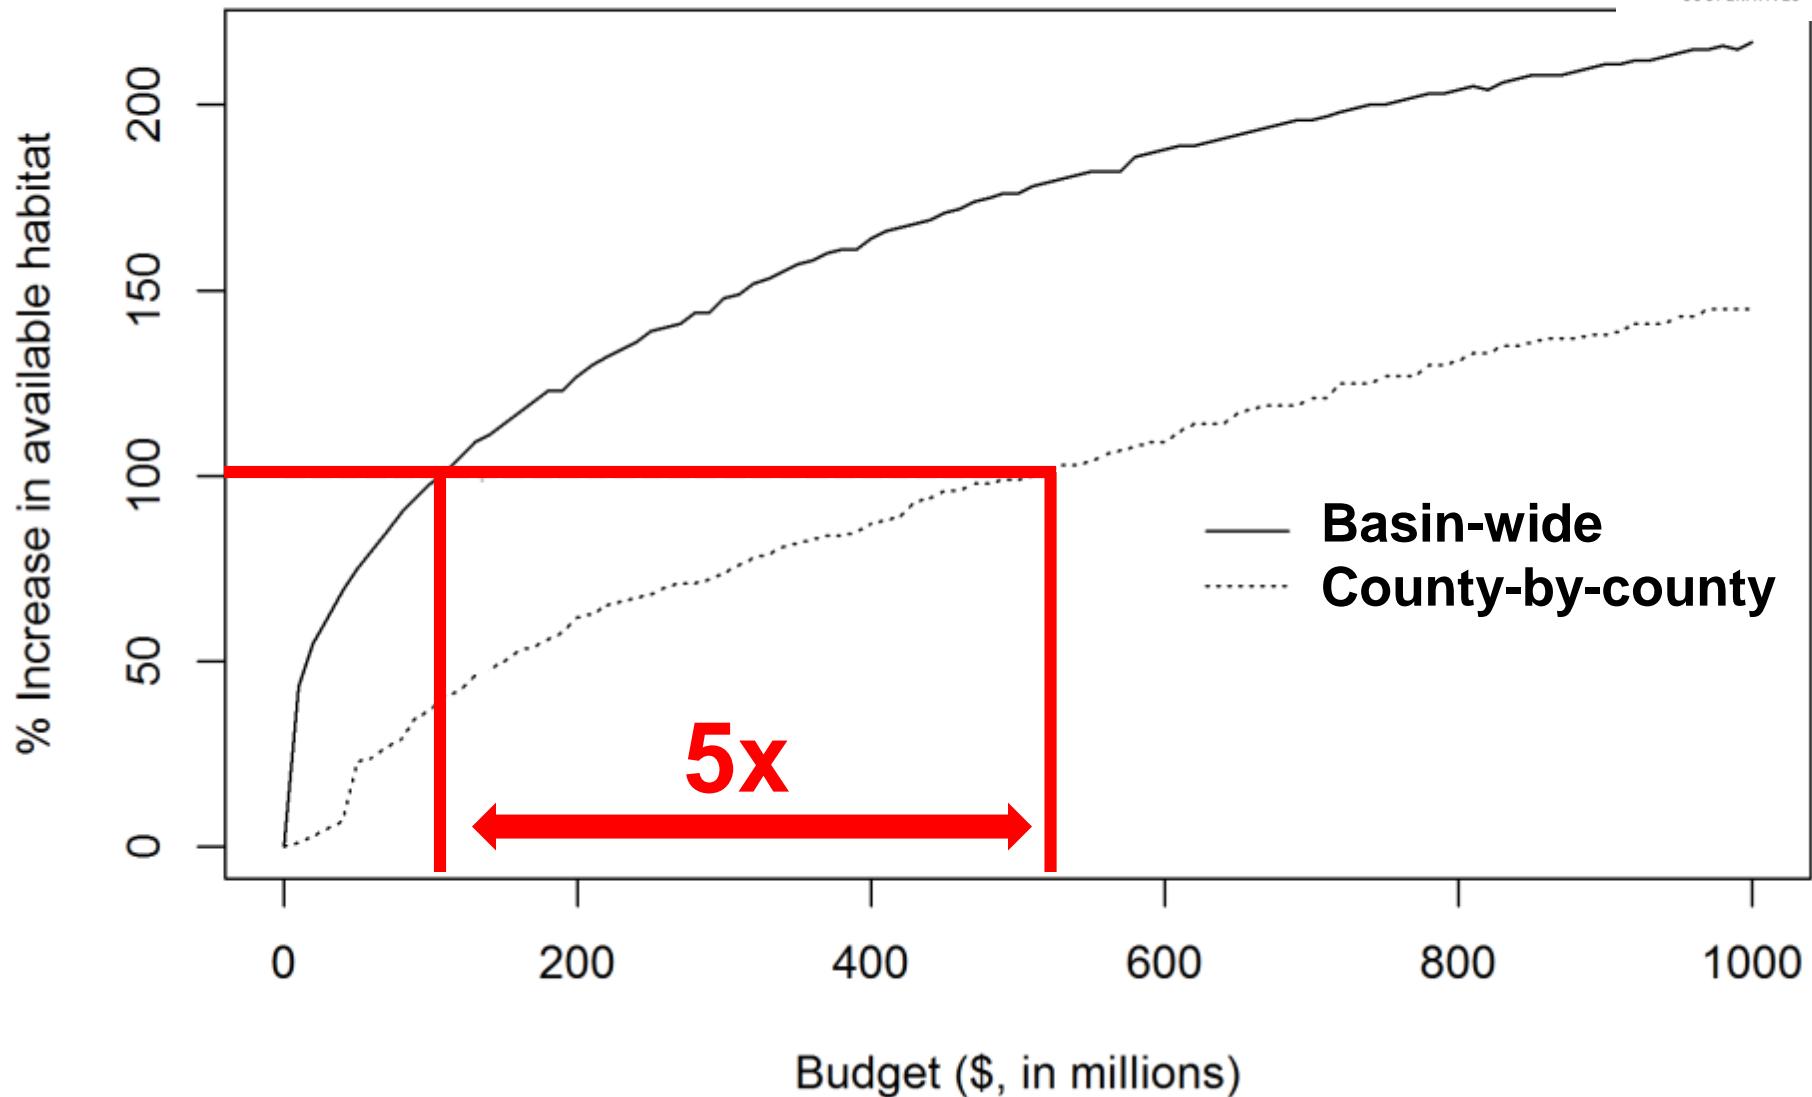

- Road crossings
- Dams

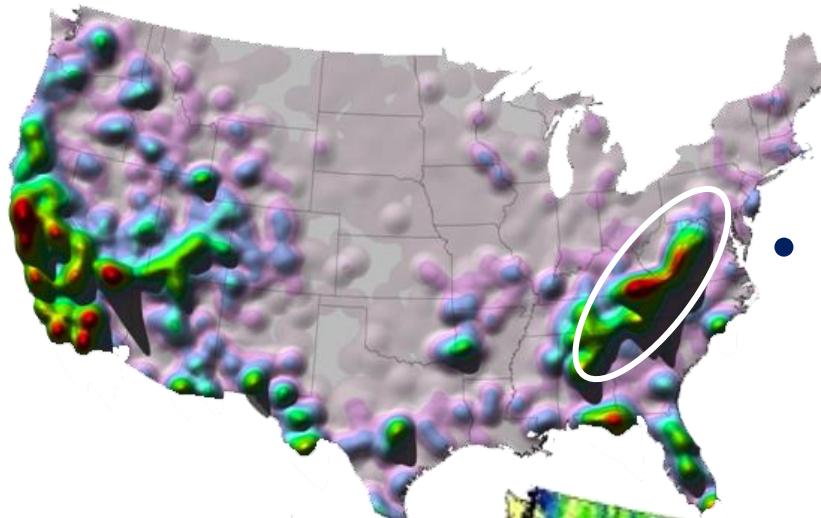

- 270,000+ potential barriers
- Are barriers passable?
- Removing which barriers provides the most benefit?
- Optimization model

# Shale Gas, Wind and Water: Assessing the Potential Cumulative Impacts of Energy Development on Ecosystem Services within the Marcellus Play

Jeffrey S. Evans<sup>1,2\*</sup>, Joseph M. Kiesecker<sup>3</sup>

<sup>1</sup>The Nature Conservancy, Fort Collins, Colorado, United States of America, <sup>2</sup>Department of Zoology and Physiology, University of Wyoming, Laramie, Wyoming, United States of America, <sup>3</sup>The Nature Conservancy, Fort Collins, Colorado, United States of America

### Abstract

Global demand for energy has increased by more than 50 percent in the last half-century, and a similar increase is projected by 2030. This demand will increasingly be met with alternative resources causes disturbances that strongly impact terrestrial ecosystems. These disturbances cover more than 160,934 km<sup>2</sup> in an area that provides drinking water to metropolitan areas in the United States (e.g. New York City, Philadelphia, Boston). Probability surfaces representing development potential of the Marcellus Shale in the Appalachian Mountains were used to predict future potential impacts on surface drinking water. Our analysis

### CONCEPTS AND QUESTIONS

## Development by design: blending landscape-level planning with the mitigation hierarchy

Joseph M Kiesecker<sup>1\*</sup>, Holly Copeland<sup>2</sup>, Amy Pocewicz<sup>2</sup>, and Bruce McKenney<sup>3</sup>

2012

Compensatory mitigation, or biodiversity offsets, provide a mechanism for maintaining or enhancing environmental values in situations where development is being planned, despite detrimental environmental impacts. Offsets are generally intended as an option for addressing any remaining environmental impacts of a development plan, after efforts have been made to avoid, minimize, or restore on-site impacts. Although offset programs require that developers adhere to the mitigation hierarchy to avoid, minimize, and restore on-site before considering an offset for residual impacts, no quantitative guidelines exist for the decision-making process. What criteria are needed to require that impacts be minimized or avoided? Here, we examine how conservation planning can provide a way to address this issue. By blending landscape-level conservation planning with application of the mitigation hierarchy, we can ensure that biodiversity offsets is consistent with sustainable development practices.

### Lower-Impact Shale Development with The Nature Conservancy's Shale Siting Tool

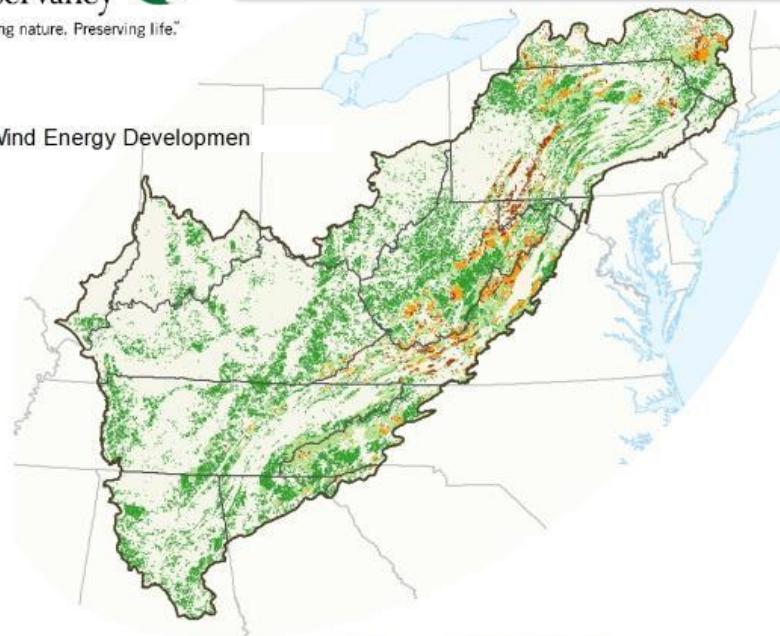

In cooperation with energy companies and academic researchers, The Nature Conservancy has built an analytical tool that will help shale developers reduce ecological impacts while profitably developing shale oil and gas reserves.

Deliver Science

# LCC Network example: Alaska and NW Canada

- The 5 LCCs that cover Alaska and NW Canada and the Alaskan CSC are collaborating on a number of projects that support critical science needs
  - National Hydrography Dataset
  - Water Temperature Monitoring Network
  - Coastal Hazards
- Developing Integrated Ecosystem Model

# Summary response to questions

- How can multi-resource analysis for landscapes be defined and guide decision making?
  - Bring multi-disciplinary partners together to identify shared vision, goals, and information needs
- What key relationships are needed and what impacts are most relevant?
  - Depends on landscape, partners need to identify important impacts
- What datasets are needed?
  - Depends on question but typically a wide range of datasets

# Closing observations

- No single organization can tackle our future challenges
- Landscape-based framework to guide decision making requires bringing partners together to:
  - Develop shared vision, goals and objectives
  - Identify existing data sets and data gaps
  - Make the work happen collectively (shared resources, overcome or work within jurisdictional authorities, etc.)
- Landscape Conservation occurs locally but we must think regionally!
