

The U.S. Government Role in Preserving Geoscience Sample and Data Collections

Ester Sztein, PhD

National Academies of Sciences, Engineering, and Medicine

American Geophysical Union, 2016

This presentation represents the author's views and not necessarily those of the National Academies of Sciences, Engineering, and Medicine

What are object-based scientific collections?

“Sets of physical objects, living or inanimate, and their supporting records and documentation, which are used in science and resource management and serve as long-term research assets that are preserved, catalogued, and managed by or supported by Federal agencies for research, resource management, education, and other uses.”

OSTP March 2014 memo

Why preserve physical collections?

- Vouchers from earlier critical findings
- Standards
- Repositories for rare samples too expensive or impossible to recollect
- Samples for future analysis/experimental use
- Scientific collections for purposes originally unforeseen
- Old samples can be reprocessed with new technology: new knowledge (reusability)

Preserving a collection?

36

GEOSCIENCE DATA AND COLLECTIONS

SIDE BAR 2-10

Examples of Inaccessible Geoscience Data and Collections

- 1) The paleontological collection at USGS Denver Federal Center is probably the largest such collection in the United States for which there is no funding for curation. It is also one of the largest with no standardized, computerized catalog. Knowledge about the collection resides with only a few people, many of whom are retired. As large and scientifically important as the USGS fossil collection is, there is no budget for collections management (committee survey response, 2001). Staff paleontologists have direct responsibility for curating their own collections (each cataloging specimens in their own style), yet official allocated time for curation is zero. The result is a variety of catalogs in handwritten ledgers, typed index cards, or computer database systems with no standardized format or medium of storage. Individual collections are commonly accessible only when the investigator is present. When a scientist retires or leaves, much of the institutional memory about the collection also departs. (The committee visited the paleontological collection in June 2001.)
- 2) An independent oil company, HS Resources, acquired Amoco's interests in an oil field in 1997. By June 2001, after being stored outdoors for 2 years, the cores were on unorganized pallets in a warehouse with random equipment laid on top of them. HS Resources merged with Kerr McGee in September 2001. The cores were still in the same location in February 2002 (John Ladd, Kerr McGee Rocky Mountain Corporation, personal communication, 2002).
- 3) DOE cores stored at Oak Ridge National Laboratory (ORNL) in Tennessee are stacked outside buildings in the open air and are overgrown with weeds (see photograph below). If they are not curated soon, these cores will be useless. Even if the rock should survive, the boxes and annotations on the samples will be lost, thus rendering them nearly valueless. The cores in the photograph in this sidebar were obtained by the Tennessee Valley Authority on the Clinch River Breeder Reactor site. Cores at DOE's Hanford, Washington, site also are exposed to the elements, although they are not maintained as poorly as those at Oak Ridge. In addition, the operating contractor in charge of ORNL, University of Tennessee-Battelle, has indicated that it may dispose of all but a few thousand feet of the 35,000 feet of rock core for the Oak Ridge Reservation—samples that indicate the fractured rock characteristics and basic subsurface geology for the ORNL site. The replacement cost for these cores is estimated at \$5 million to \$10 million (Richard Ketelle, Bechtel Jacobs Company LLC, personal communication, 2002).

Cores stored outside at Oakridge National Laboratory, Tennessee, in Spring 2001. These cores are from the Tennessee Valley Authority's Clinch River Breeder Reactor site. Rescue of cores in this state of degradation is unlikely given the probable loss of documentation associated with them. SOURCE: Richard Pawlowicz, Bechtel National, Inc., San Diego, California.

Geoscience Data and Collections: National Resources in Peril (NRC, 2002)

A good physical collection...

- Well documented- metadata attached
 - › field number
 - › geographic location,
 - › collector,
 - › date collected,
 - › sample type,
 - › reason for collection,
 - › project name,
 - › other important data analysis and derivative samples
- Well preserved and curated

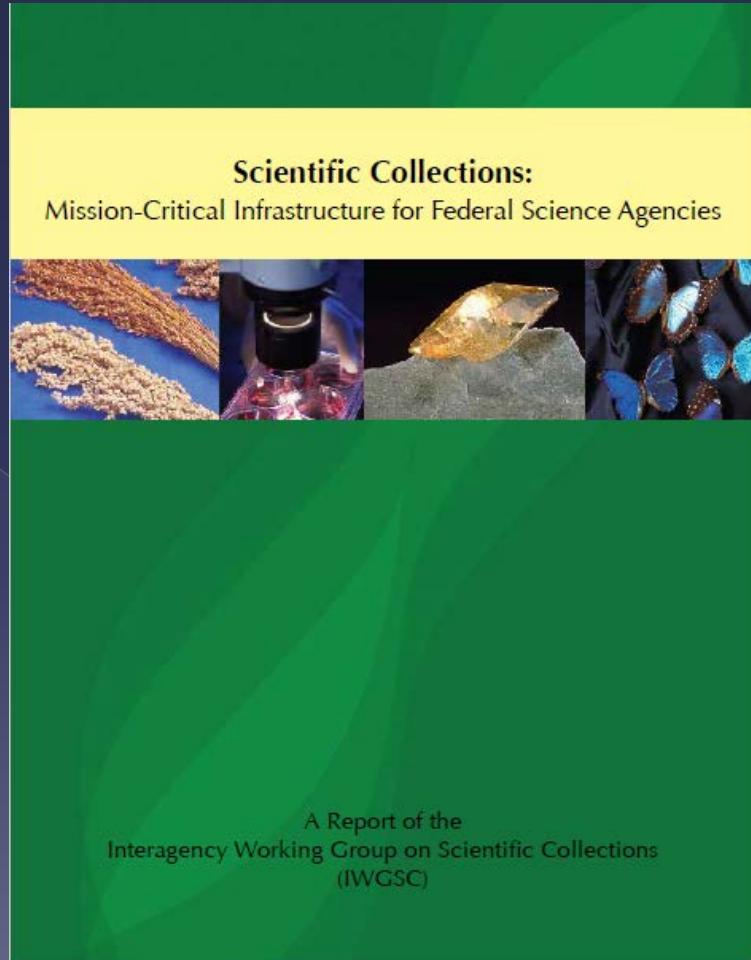

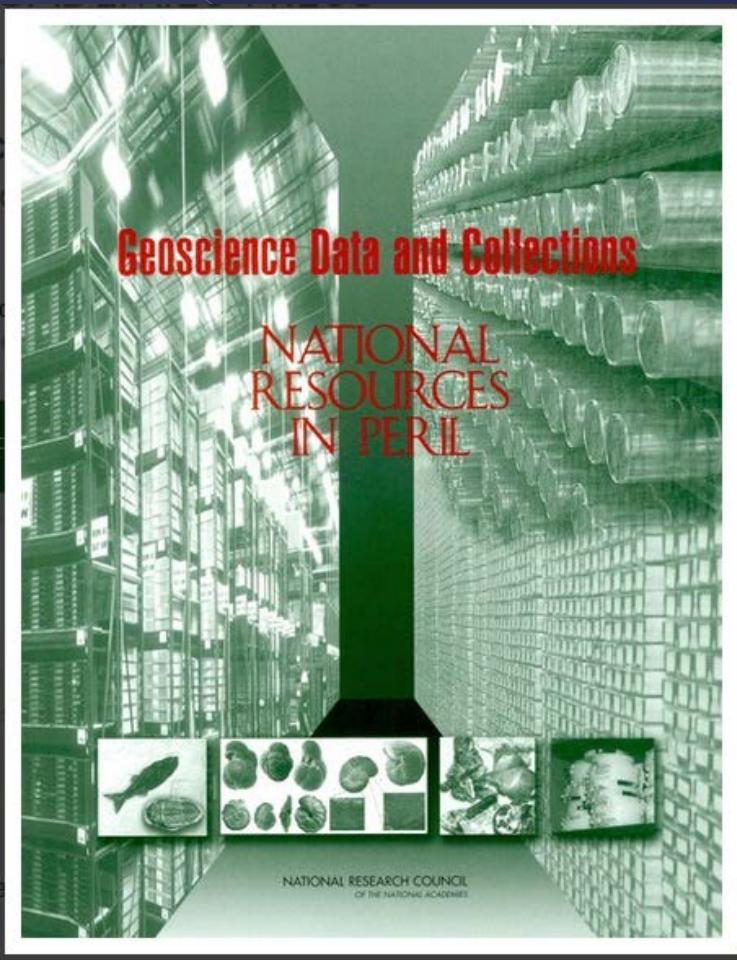

Why the USG?

- Federally-supported science collections are public assets
- Support mission-critical science
- Excellent ROI for U.S. taxpayers
- Historic bipartisan interest

BUT: No one-size-fits-all approach

- Each Agency develops its own policies and procedures to ensure access, storage, transfer, and disposal of geologic samples and data

Important reports: NRC 2002, IWGSC 2009

Interagency Working Group on Scientific Collections (IWGSC)

- In 2006 by White House National Science and Technology Council: focus attention and planning for Federal/Federally-funded collections management
- Run by OSTP; USDA & Smithsonian co-chairs
- 15 USG Agencies with scientific collections and/or granting programs
- Most GEO collections are in 8 Agencies
- 21% of their collections are geoscience
- 2009 Green Book includes 7 recommendations

IWGSC's first 3 recommendations

- Budgeting for Collections
 - › Collect/share budgeting information
 - › Assess/project costs
- Policies and Best Practices
 - › Identify/disseminate: organization, management, access (physical and online), long-term preservation
- Data and Metadata Accessibility
 - › Document physical objects; make collection information available online
 - › Develop online clearinghouse for information on contents and access to Federal scientific collections

OSTP 2014 memo asks each agency to develop plans to manage their physical scientific collections

"To improve management of and access to scientific collections"

"An essential base for developing scientific evidence and ... resource for scientific research, education, and resource management"

End goal: "systematic improvement of the development, management, accessibility, and preservation of scientific collections owned and/or funded by Federal agencies"

Only for long-term institutional, archival collections, not for short-term, project collections

EXECUTIVE OFFICE OF THE PRESIDENT
OFFICE OF SCIENCE AND TECHNOLOGY POLICY
WASHINGTON, D.C. 20502

March 20, 2014

MEMORANDUM FOR THE HEADS OF EXECUTIVE DEPARTMENTS AND AGENCIES

FROM: John P. Holdren, Assistant to the President for Science and Technology, and Director, Office of Science and Technology Policy

SUBJECT: Improving the Management of and Access to Scientific Collections

1. Scientific-Collections Policy Principles

Scientific collections provide an essential base for developing scientific evidence and are an important resource for scientific research, education, and resource management. Scientific collections represent records of our past and investments in our future. They are also tools that can be harnessed to address challenges facing humankind. Federally supported scientific collections are public assets, and their stewardship by Federal agencies carries with it trustee responsibilities. Policies and procedures for maintaining, preserving, and developing Federal scientific collections while also increasing access to those collections for appropriate use are, therefore, central to their value.

2014 Memo on Scientific Collections

Each Agency's policy to include:

- Role to advance its mission
- Legislative/regulatory requirements
- Who has responsibility to carry out policies
- How to project costs of developing, preserving, managing scientific collections
- Agency requirements and standards for long-term preservation, maintenance, accessibility for public use
- Strategy to provide online information about physical collection contents and access to objects and digital files, unless limited by law or to protect national interests
- Process to de-access, transfer, dispose of collections
- Resources within each Agency to implement policy
- Consistency with 2013 Open, Machine-Readable Data OSTP memo
- Agencies to work together, coordinate through IWGSC

US Federal Scientific Collection Registry

Curated source of information about
object-based science collections owned
or managed by US Federal departments
and Agencies (usfsc.grscicoll.org)

Supported by IWGSC, managed by SI

Scientific Collection Policy Status by Agency

Of the 15 USG Agencies, 8 have significant geoscience collections

- National Aeronautics and Space Administration
 - > NASA Policies
- National Science Foundation
 - > Policies: In Development
- Smithsonian Institution
 - > SI Collections Management Policy; SI Reports and Other Policies; SI Collections Space Framework Plan
- U.S. Department of Agriculture
 - > USDA ARS Collections Policy
 - > USDA ARS Reports
 - > FSIS Policies: In Development
 - > APHIS, NIFA, NRCS, USFS Policies: Expected December 2016
- U.S. Department of Commerce (NIST, NOAA)
 - > NIST Policies: Expected December 2016
 - > NOAA Policies: In Development
- U.S. Department of Energy
 - > Policies & Reports: Awaiting content submission
- U.S. Department of Interior (BIA, BLM, NPS, Reclamation, FWS, USGS)
 - > Interior-wide Museum Collection Policies and Program Reports
- U.S. Environmental Protection Agency
 - > EPA Scientific Collections Policy

The U.S. Geological Survey Geologic Collections Management System (GCMS)

A Master Catalog and Collections Management Plan for
U.S. Geological Survey Geologic Samples and Sample Collections

Circular 1410

U.S. Department of the Interior
U.S. Geological Survey

<http://pubs.usgs.gov/circ/1410/>

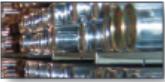

USGS Geologic Collections Management System (GCMS)

- Virtual network connecting USGS sample collections housed throughout the US to be used by US and foreign scientists
- Does NOT specifically address the preservation of digital data (seismic, magnetic, electric) or library materials
- ScienceBase (cyberinfrastructure for samples and data) will integrate GCMS and geologic data repositories

ScienceBase

ScienceBase

Sample Repositories
Includes accompanying digital and physical data and catalogs

Geologic Data Repositories
Includes standardized data catalogs and portals

Geologic Collection Management System (GCMS)
Gathers information from physical repositories and maintains a standardized master catalog of all USGS geologic collections

National Repositories

- Core Research Center
- National Ice Core Laboratory
- O'Brien Street Warehouse

Science Center Repositories

- Alaska
- Astrogeology
- Earth Surface Process Centers
- Energy Resource Centers
- Geologic Hazard Centers
- Mineral Resource Centers
- St. Petersburg
- Woods Hole

USGS Geoscience Data
Includes digital data from USGS programs not associated with physical repositories cataloged by the GCMS

Digital and Analog Databases

- Geochemical databases
- Geophysical databases
- Geolex (Lexicon of Geologic Names)
- Geologic map database
- National paleontological database

Data Discovery Portals

- Astrogeology data and information
- Coastal and Marine Infobank
- Earthquake Hazards
- Energy Program publications and data
- Geomagnetism
- Landslide Hazards
- Minerals Information
- Volcano Hazards

Figure 2. ScienceBase is cyberinfrastructure developed by the U.S. Geological Survey (USGS) that organizes, catalogs, and integrates scientific data for USGS and partner programs and projects (<https://www.sciencebase.gov/catalog/>). As a part of ScienceBase, data collected by the Geologic Collections Management System will be accessible in context with complementary USGS geoscience data.

Some definitions

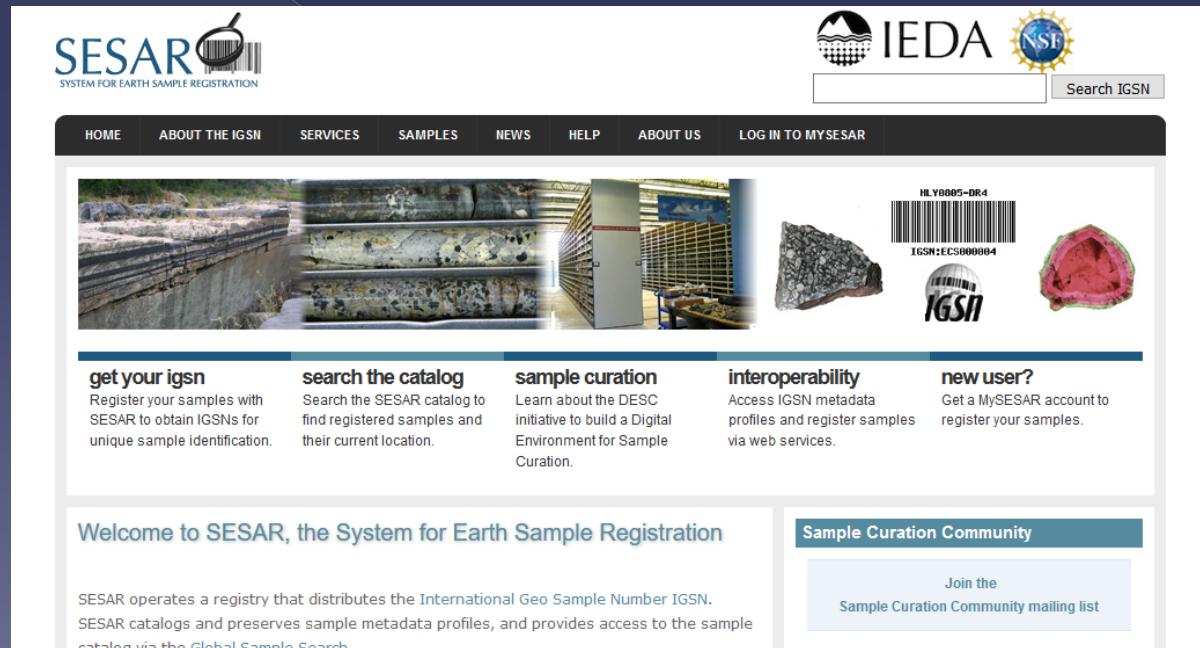

- An **active collection** (aka **working collection**) contains material from ongoing research and is actively used by the project scientists. New samples are added as research continues. When completed, materials will be evaluated for permanent retention in a GCMS repository.
- A **legacy collection** contains samples from research scientists who are no longer with the USGS. With proper documentation, these collections will be incorporated into the GCMS and treated as resource collections.
- An **orphan collection** consists of poorly documented samples with little foreseeable research value and do not warrant inclusion in the GCMS. If still have education/outreach value, may be transferred to another entity.
- A **reference collection** contains samples of a distinct nature that provide an objective standard against which other samples are compared. This type of collection may be augmented with new samples.
- A **resource collection** contains materials from completed research that remain significant as research assets and are made available for current and future research and preserved for an indefinite period of time.

Universally Unique Identifiers (UUID)

Sample identification needs to be standardized.

As each active repository contributes the metadata for its sample inventories through the GCMS to the centralized registry, each sample will be assigned an UUID.

International Geo Sample Number(IGSN): Internationally-recognized ID system.

The screenshot shows the SESAR (System for Earth Sample Registration) homepage. At the top, there are logos for IEDA (International Earth Sample Inventory Data Assembly) and NSF (National Science Foundation). The main navigation menu includes links for HOME, ABOUT THE IGSN, SERVICES, SAMPLES, NEWS, HELP, ABOUT US, and LOG IN TO MYSesar. Below the menu, there are several images of geological samples and storage units. A search bar is located on the right side of the header. The main content area features five cards with links: 'get your igsn', 'search the catalog', 'sample curation', 'interoperability', and 'new user?'. The 'search the catalog' card includes a barcode and the text 'IGSN: EGS800004'. The 'sample curation' card includes a barcode and the text 'IGSN: IGS800004'. The 'new user?' card includes a barcode and the text 'IGSN: IGS800004'. At the bottom, there is a 'Welcome to SESAR, the System for Earth Sample Registration' message and a 'Sample Curation Community' section with a 'Join the Sample Curation Community mailing list' button.

Think early and often...

about your data management plan

AND

your physical collection management plan

4-Point Standard

GCMS Collection Determination Process

1. What?

Do the samples have IDs, or can they be assigned IDs?

Yes

No

2. Where?

Do the samples come with **locality** information, or can it be recovered?

Yes

No

3. Who?

Do you know **who** collected the samples?

Yes

No

4. When?

Do you know **when** the samples were collected?

Yes

No

Develop **descriptive** information if not already available.

Do the samples have iconic, historic, or scientific value?

Yes

Are some samples **useful to someone else** within the USGS or another Federal or State agency?

Yes

Can the samples provide **value to an educational institution**?

Yes

Do the samples serve any **outreach utility**?

Yes

Transfer to the individual, with appropriate documentation.

Transfer to the educational institution, with appropriate documentation.

Provide to outreach function, with appropriate documentation.

No

DISCARD SAMPLES, with appropriate documentation.

These samples meet the requirements for the USGS Geologic Collections Management System and should be retained by the USGS or transferred to the Smithsonian Institution's National Museum of Natural History.

The future of a USGS collection

- Staff scientists > initial recommendation to local collections' manager/curator
- Joint request to local collections governing board (Science Center level)
- Recommendation to USGS Collections Steering Committee: advice on vetting collection by others within/outside USGS
- Recommendations then made by local governing board with Steering Committee approval to Science Center Director for decision
- USGS provides some funds for intramural collection management and grants to State Geological Surveys and other DOI agencies
- National Geological and Geophysical Data Preservation Program: datapreservation.usgs.gov

Digital Data

- Characteristics of good digital data:
FAIR (Findable, Accessible,
Interoperable, and Reusable)
- FAIR also applicable to physical
collections
- Similar issues: appropriate metadata,
what to keep and what to discard,
and cost of managing collections

Conclusions

- OSTP issued specific directive to the Agencies
- Agency plans and strategies unevenly established and implemented
- Budget needed for collection storage, management, accessibility, and reusability
- Researchers must consider data and physical collection management strategies and cost early in the project
- Individual scientists' initiative very important
- Disciplinary and data scientists work together to ensure FAIR

Thank you for your attention
