Water quality, stream flow

Upper stream of Dara river (Doorot-Korgon village)

N 39° 33.141'

E 072° 11.395'

Elevation: 2525 м

Radiation background: 0,23 mrSv

Eutech instruments	Velocity	
pH = 8.47, t = 8,4 °C	Q = 2,427 m³/S	Q = 2,668 m³/S
Ion = -82 mS	V = 1,44 m/S	V = 1,6 m/S
Conductivity = 316,2 µS	H = 1,665 m	H = 0,664 m
TDS = 303,2 ppm	12:42	
NaCl = 281,1 ppm	Q = 1,950 m³/S	Q = 2,440 m³/S
Resistivity = 1,650 kΩ	V = 1,24 m/S	V = 1,47 m/S
O2 = 74,6% , 5,7 mg/L при t=12,4 °C	H = 1,584 m	H = 0,684 m

Dara river end,joined with Kyzyl-Suu river

N 39 33.851'

E 072 11.789'

Elevation: 2473 м

Radiation background: 0,22 mrSv

pH = 8.71, t = 13,9 °C	Q = 2,066 m³/S	Q = 2,167 m³/S
Ion = -97,9 mS	V = 1,23 m/S	V = 1,29 m/S
Conductivity = 310,6 µS	H = 0,674 m	H = 0,705 m
TDS = 297.5 ppm		
NaCl = 285.8 ppm		
Resistivity = 1,681 kΩ		
O2 = 72% , 5,08 mg/L при t=14 °C		

Methods

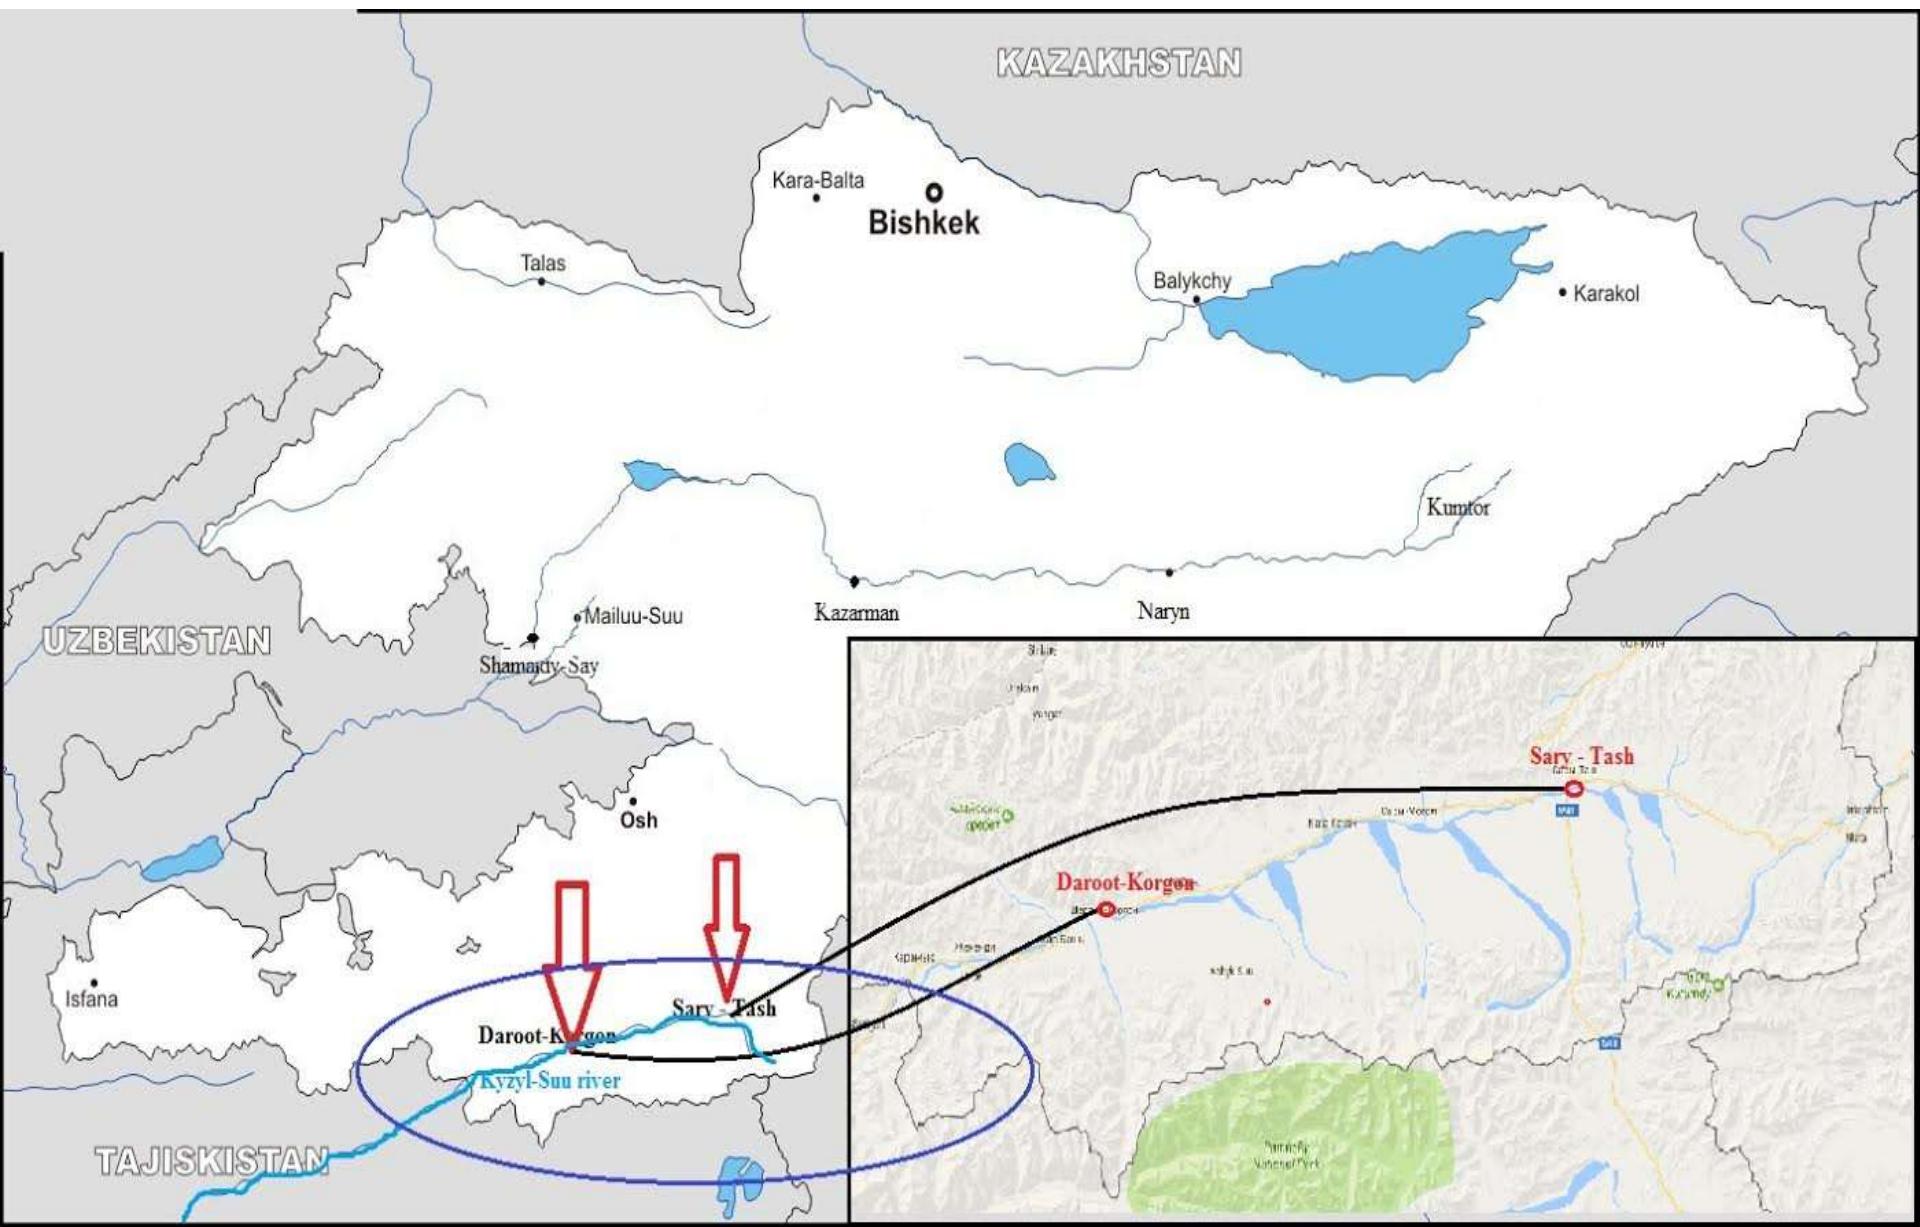

Land cover and land use classification practices by using remote sensing

- On-site, ground surveys are desirable for high-quality and valid land cover classification
- Use of cadastral maps would be beneficial for land classification as well.

Interaction between NDVI and weather variables

- Climate change affects precipitation, temperature and NDVI globally
- By understanding the relationship between NDVI and climatic variables it is possible to predict future climate change scenario.

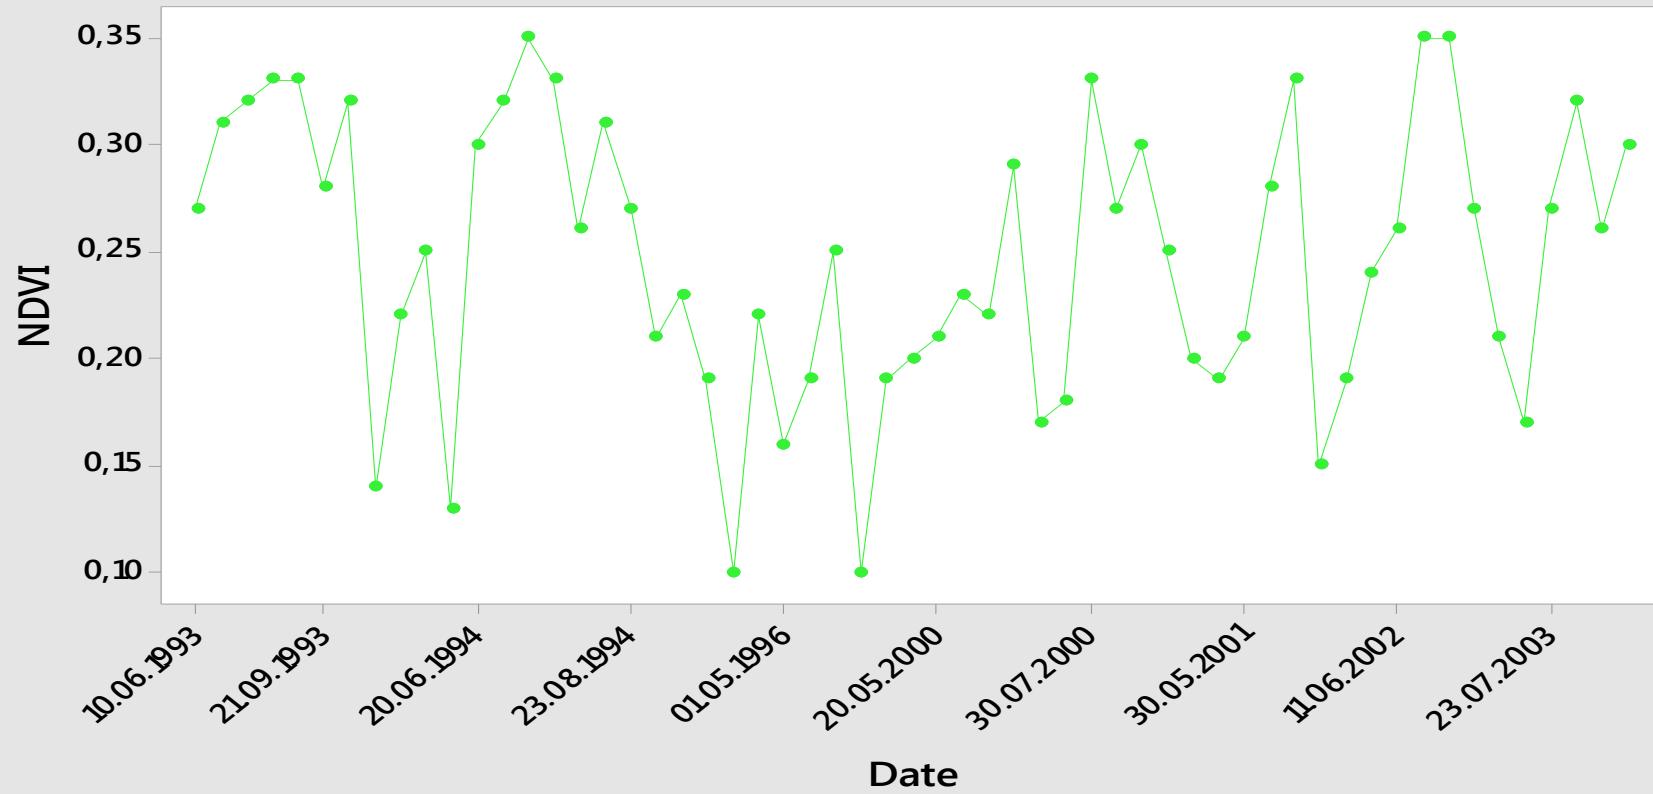

Kyzyl-Suu River Basin

Results

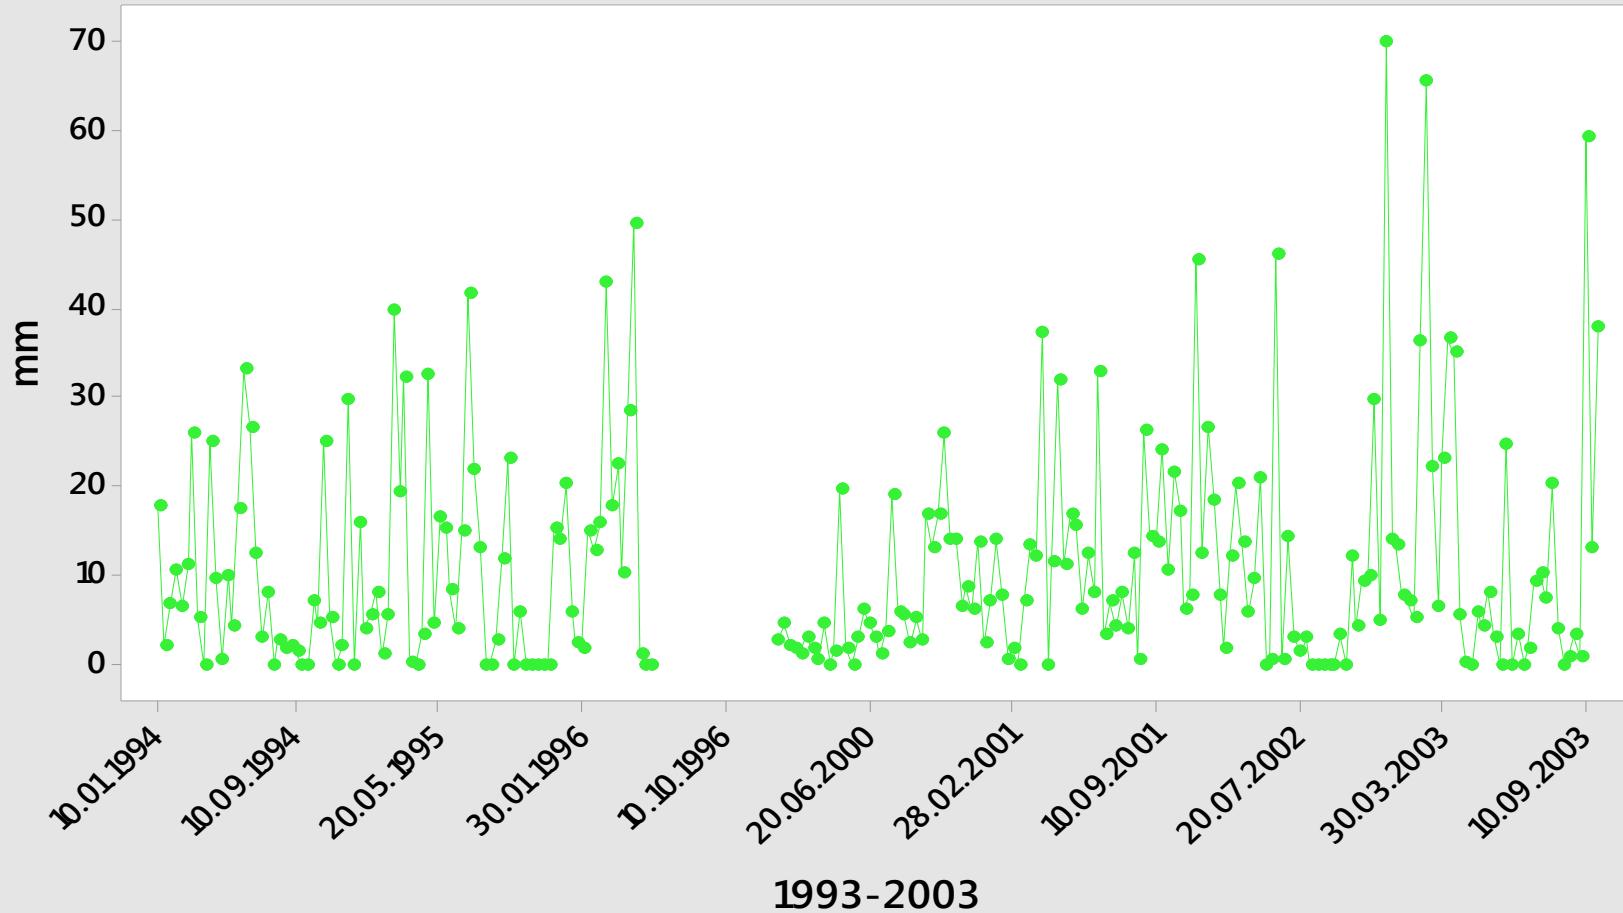

- Two years (1994, 2003) have been found with significant correlation coefficient between NDVI and climatic variables
- Not enough to establish a significant annual trend between NDVI and climatic variables
- Seasonal trend was found: as a rule, the lowest NDVI values are observed in May than reaches its peak at the end of July and at the beginning of August and decreases at the middle or end of September
- Trend was found in NDVI values over the last five years in Daroot-Korgon – there is an inter-annual even distribution of values without any sharp fluctuations and variations

Time Series Plot of NDVI 1993-2003

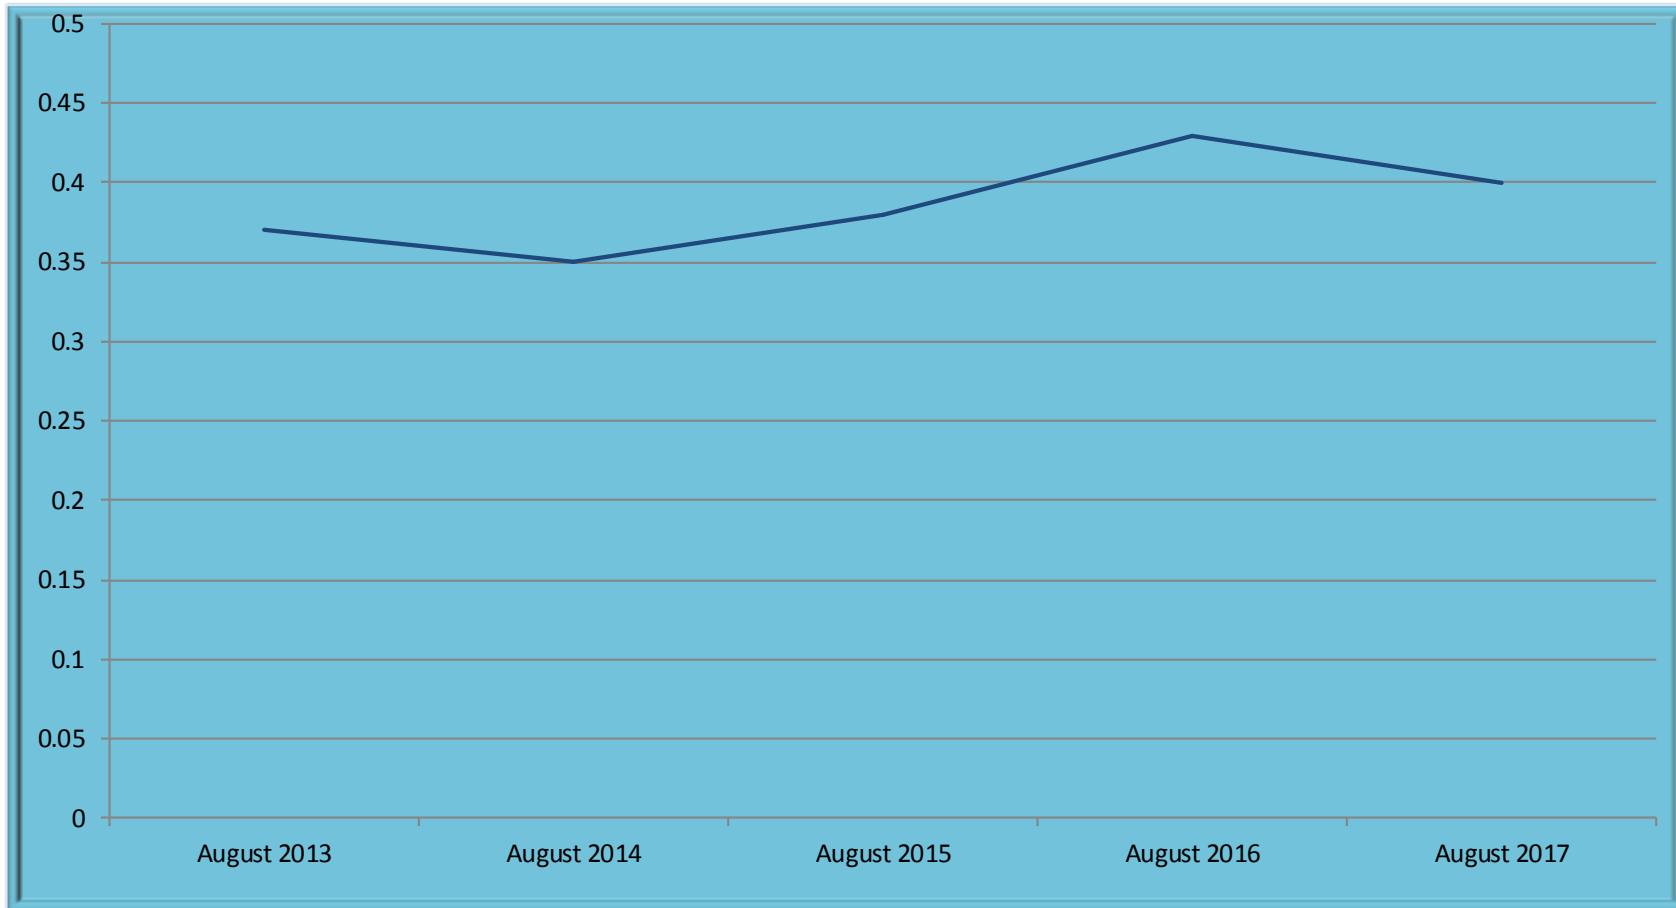

Time Series Plot of Precipitation from 1993 to 2003

Time series of NDVI over the last five years

August 2013	August 2014	August 2015	August 2016	August 2017
0.37	0.35	0.38	0.43	0.40

Daroot – Korgon summer NDVI value 2013

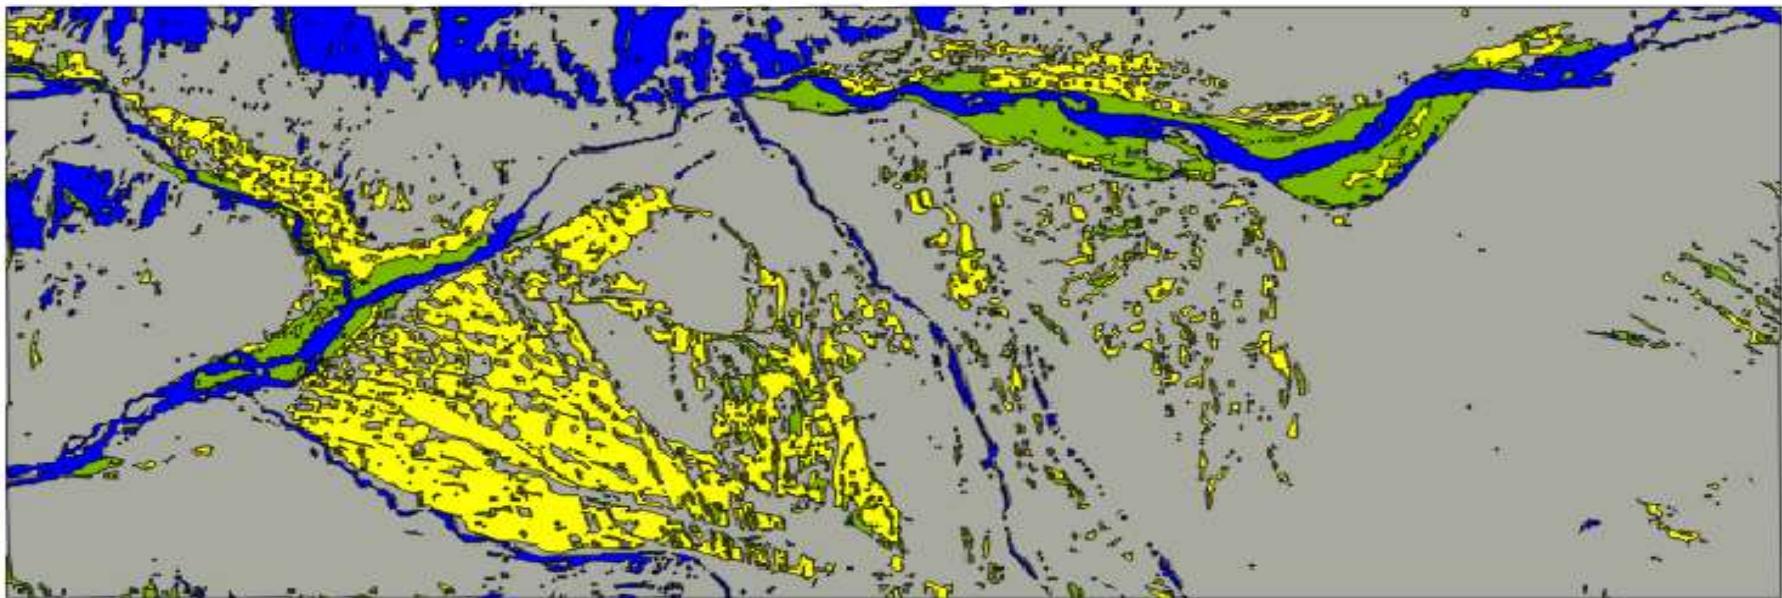

Daroot – Korgon summer NDVI value 2017

Land cover classification of Daroot - Korgon

Chong-Alay Valley map. Land cover classification of Daroot Korgon administrative center

Classification

- 1 - Cropland
- 2 - Water
- 3 - Bare Soil
- 4 - Vegetation

Conclusion

- Only two years (1994 and 2003) were found with a positive correlation between NDVI and climatic variables
- Not enough to establish a significant annual trend between NDVI and climatic variables
- Seasonal trend was found: as a rule, the lowest NDVI values are observed in May than reaches its peak at the end of July and at the beginning of August and decreases at the middle or end of September
- Trend was found in NDVI values over the last five years in Daroot-Korgon – there is an inter-annual even distribution of values without any sharp fluctuations and variations.
- Due to partial lack of weather station observations as well as NDVI values, it is hard to analyze the interlink between NDVI and climatic variables

Maps

Methods of Data Collection

- Map
- GPS coordinates
- Questionnaire (qualitative)
- Preliminary preparation and practical guidelines
- Focus group

Methodology

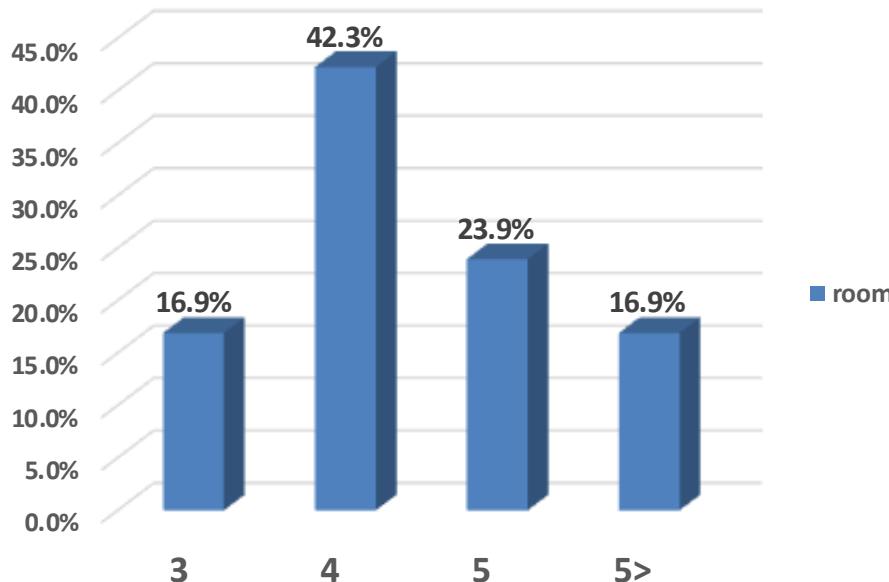

- ***Primary data:***
- Surveys and questionnaires (total: 92 households; 46 Boroldoi village, 17 Oirondu, 12 Kuntuu, 17 Daroot Korgon)
- Socio-economic analysis and compare Case Studies from Kyrgyzstan (Chui Valley and Chon Alay valley)
- ***Secondary data:***
- Software excel and Minitab
- Articles and Scientific Researches as supplementary material

Key points of socio-economic analysis

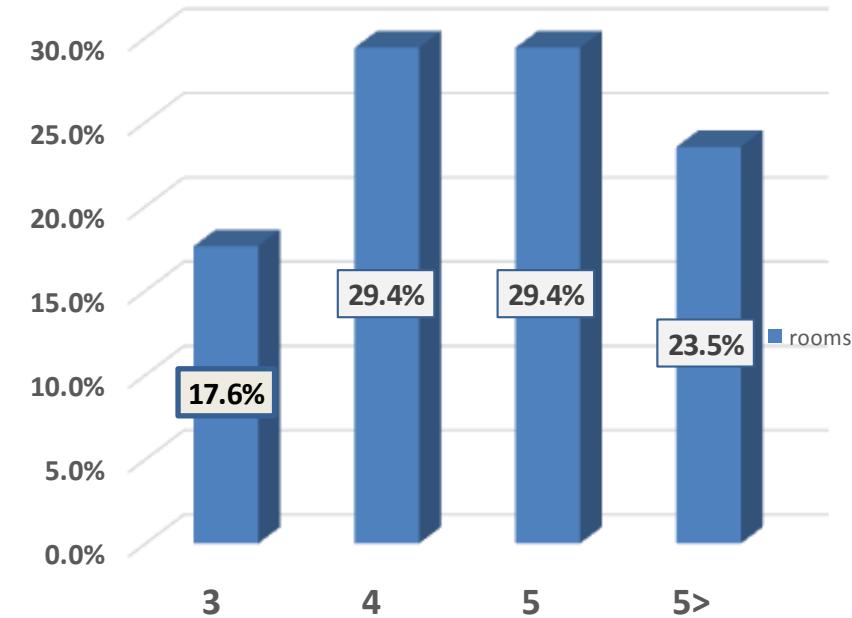

- Water Accessibility
- Household conditions
- Access to electricity
- Agricultural machinery
- Crops
- Average income
- Livestock
- Infrastructure(electricity, landline, internet)

Results and Findings

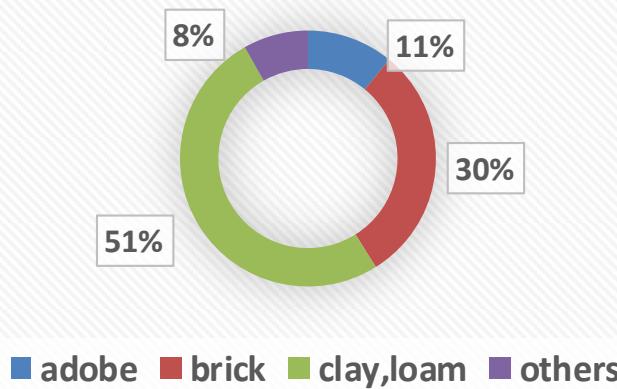

Number of rooms per house household in % in
Chui valley villages

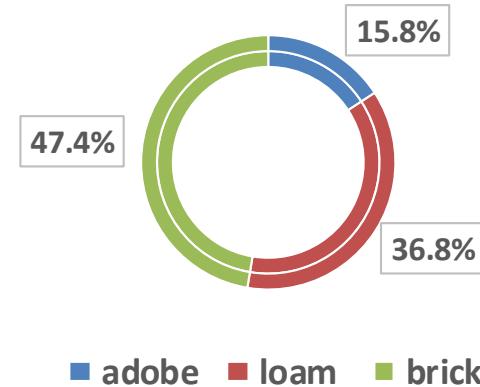

Number of rooms per household in %
in Daroot Korgon settlement

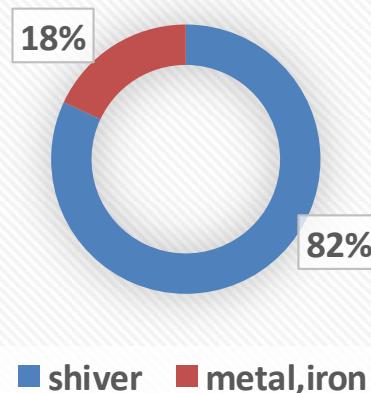

Material for wall in Chui Valley in %

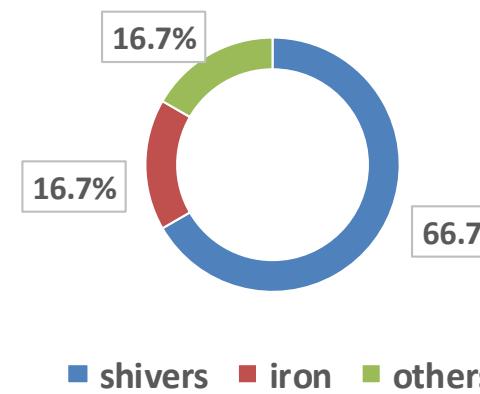

Material for wall in % Daroot Korgon

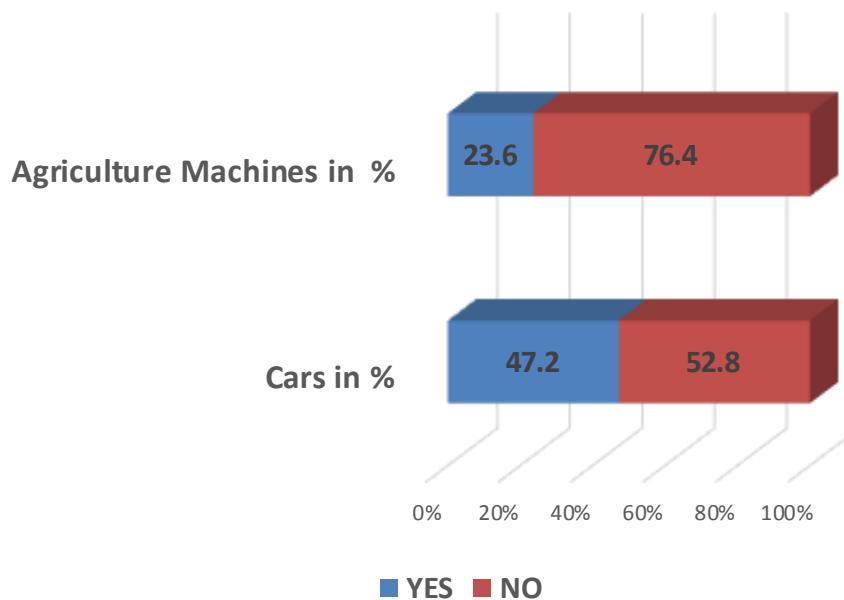

Material for roof in Chui Valley villages in %

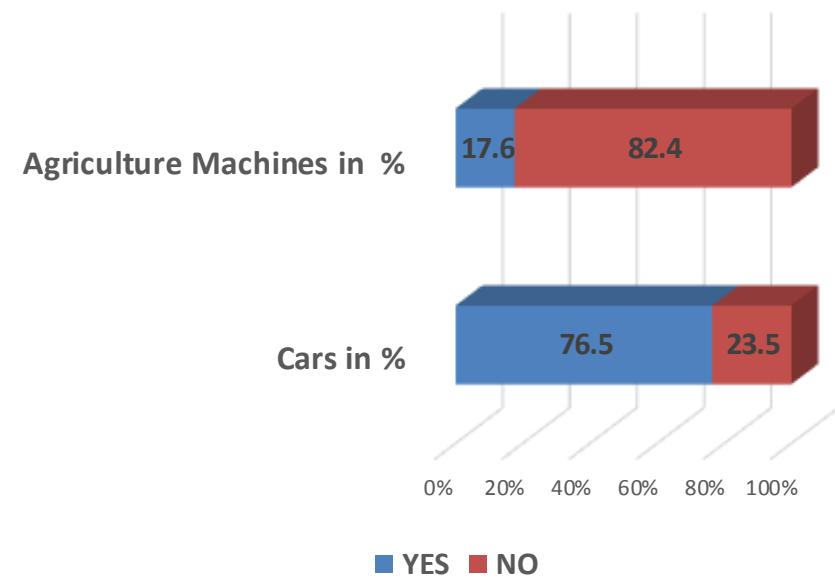

Material for roof in % Daroot Korgon

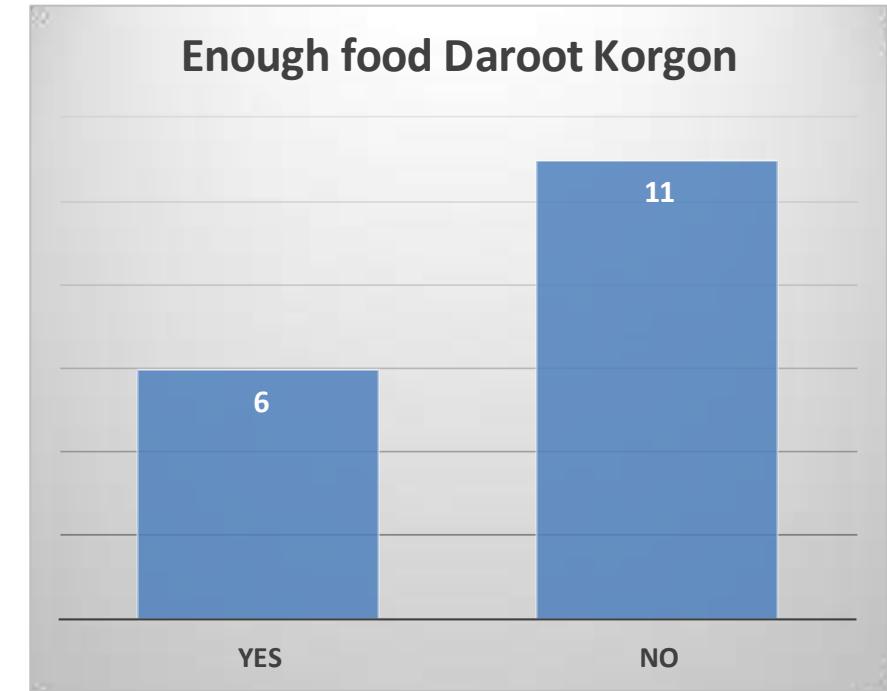

Chui Valley neighbourhoods

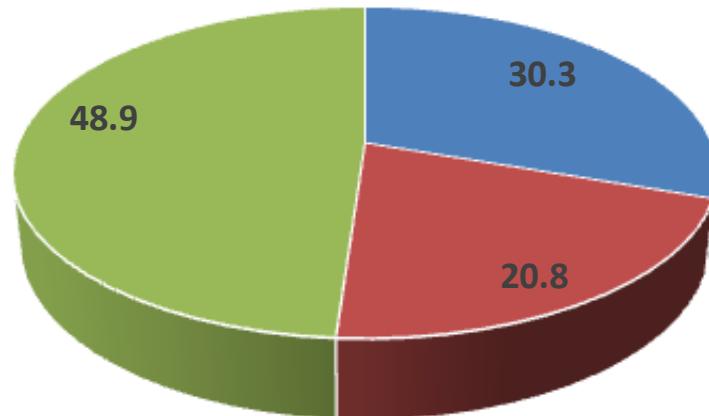

Chon Alay, Daroot Korgon

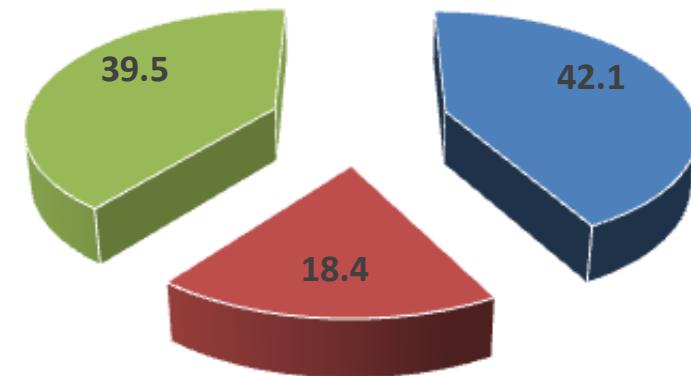

Chui Villages number of household members

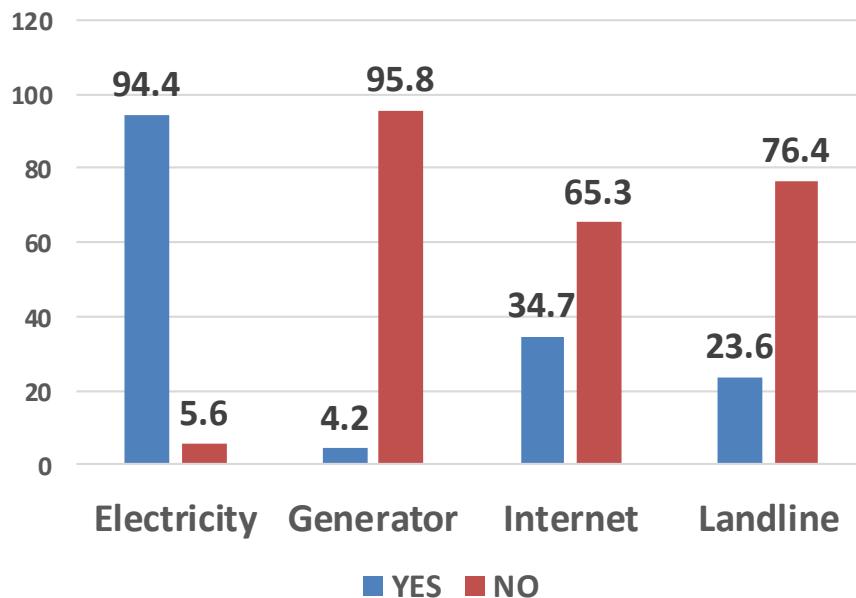

■ Children ■ Elderly ■ Others

Chon Alay, Daroot Korgon number of household members

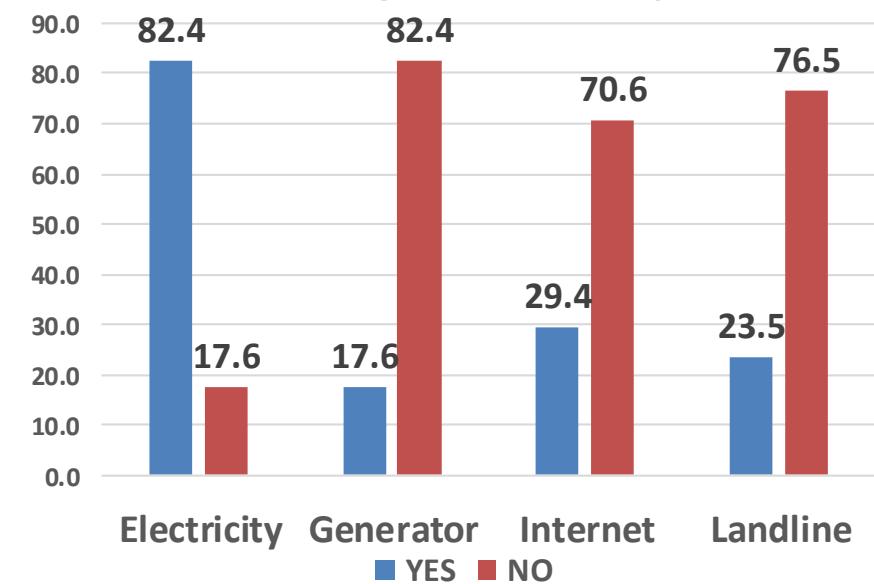

■ children ■ Elderly ■ others

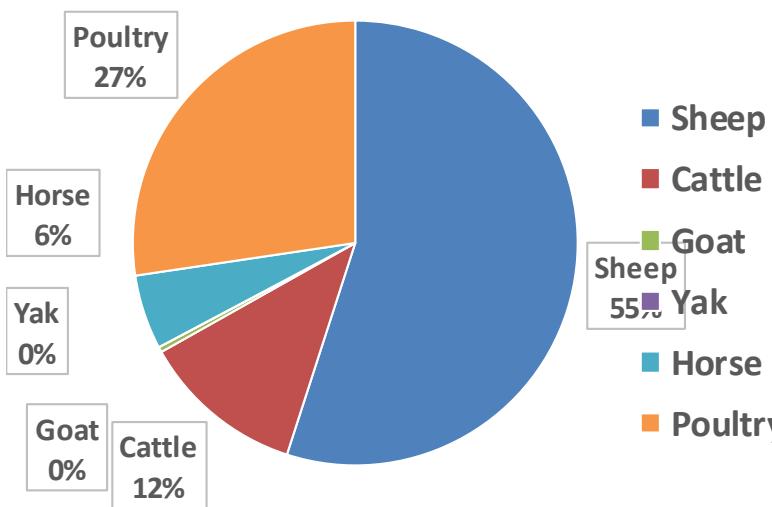

Chui valley villages in %

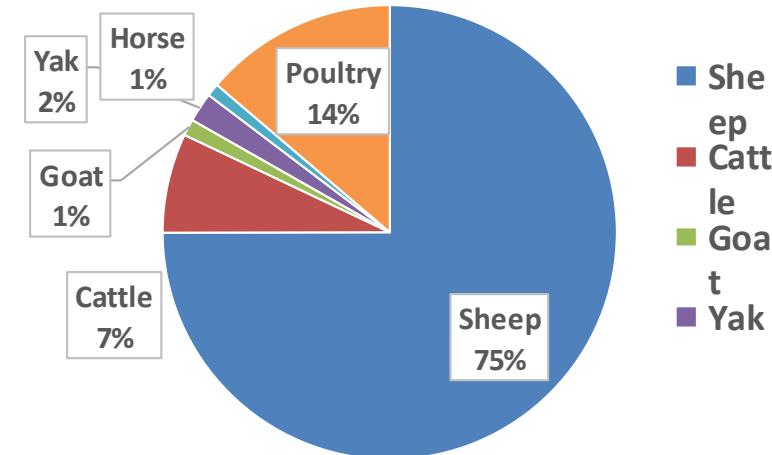

Daroot Korgon, Chon Alay in %

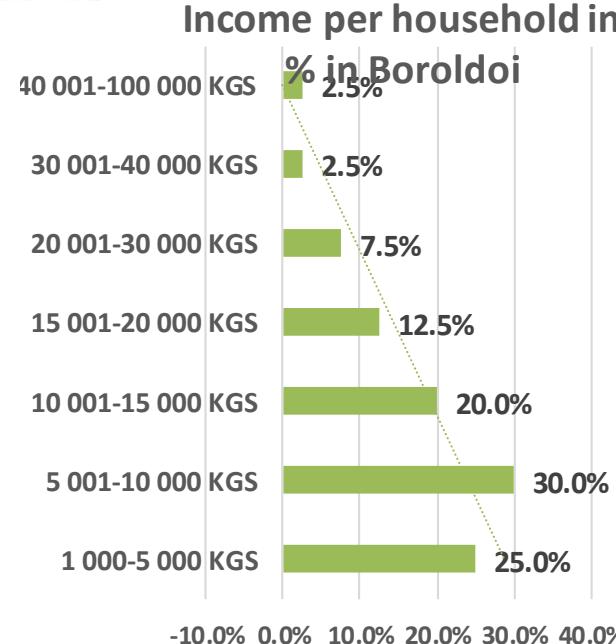

Number of livestock in Chui
Villages in %

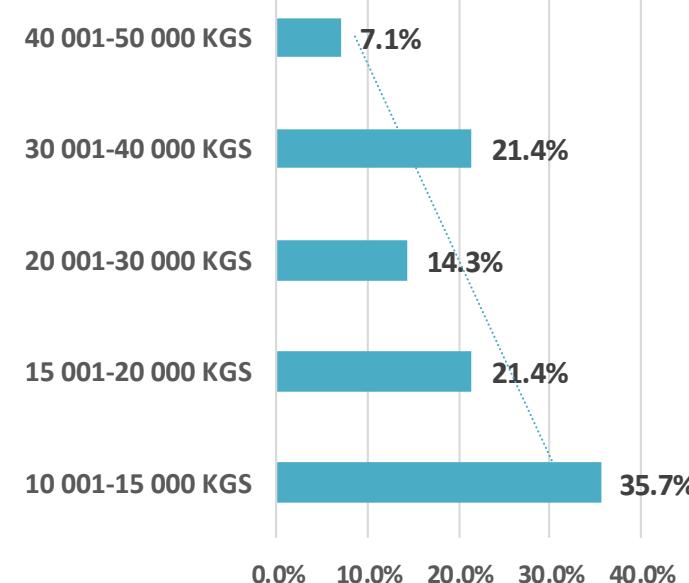

% Number of Livestocks in Chon
Alay, Daroot Korgon

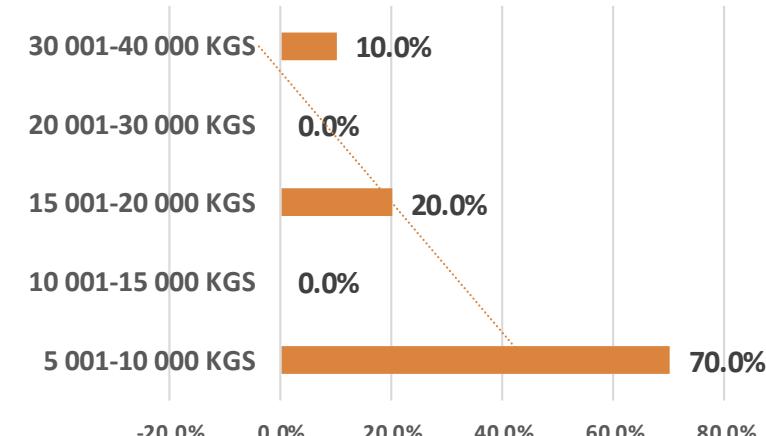

Income per household in % in Oirondu

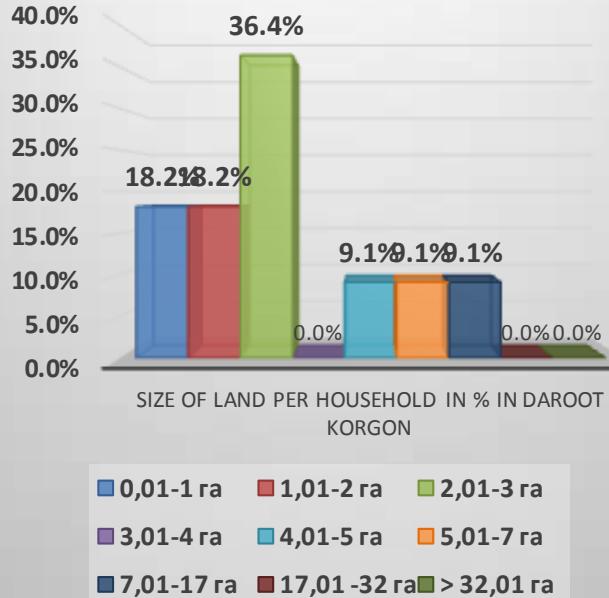

Income per household in % in Kuntuu

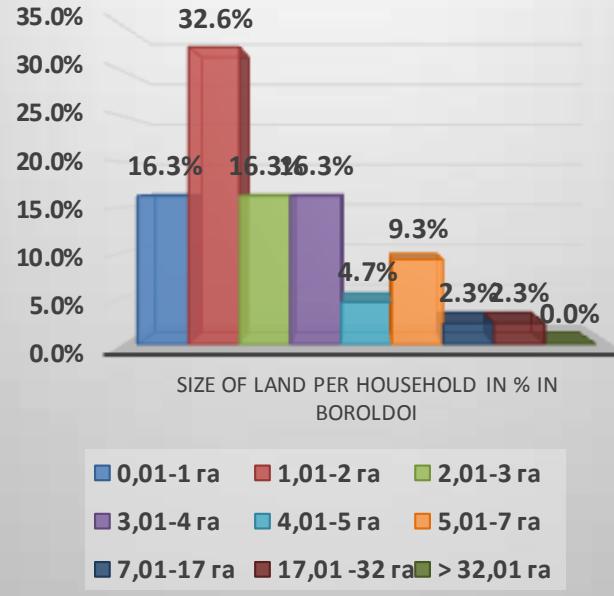

Income per household in % in Daroot Korgon

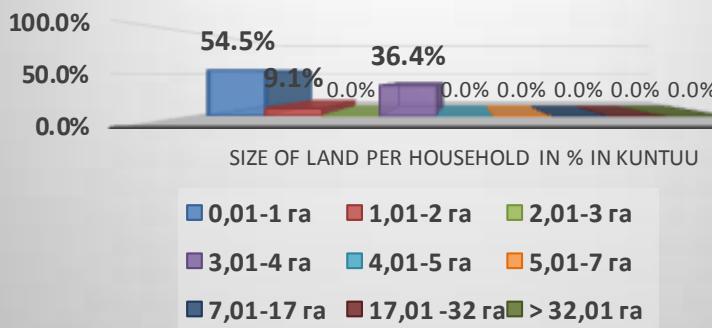

Size of land per household in % in Daroot Korgon

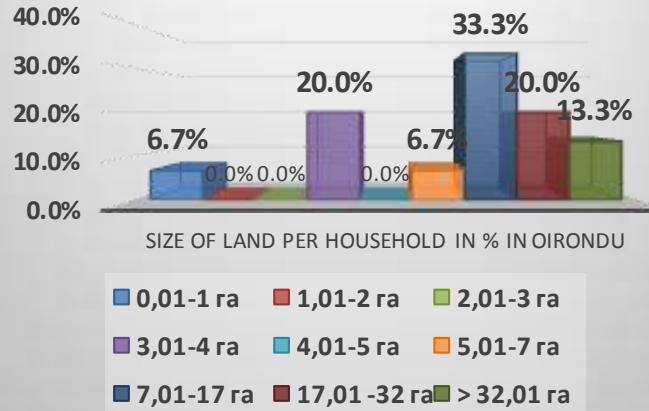

Size of land per household in % in Boroldoi

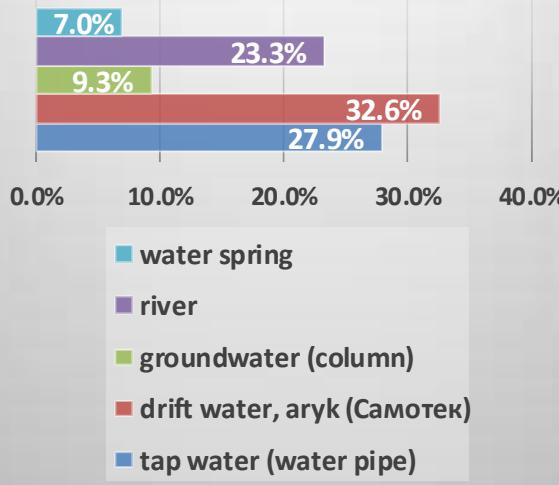

Size of land per household in % in Kuntuu

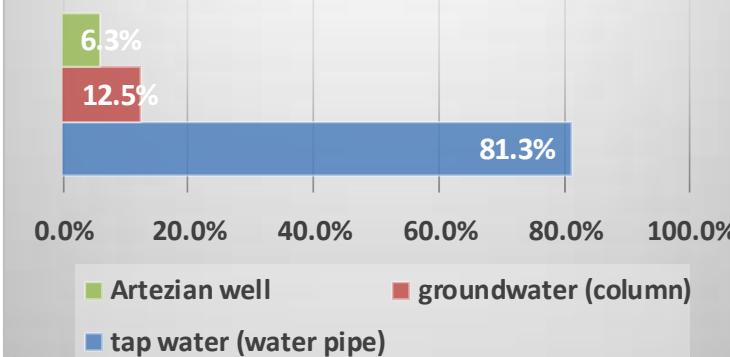

Size of land per household in % in Oirondu

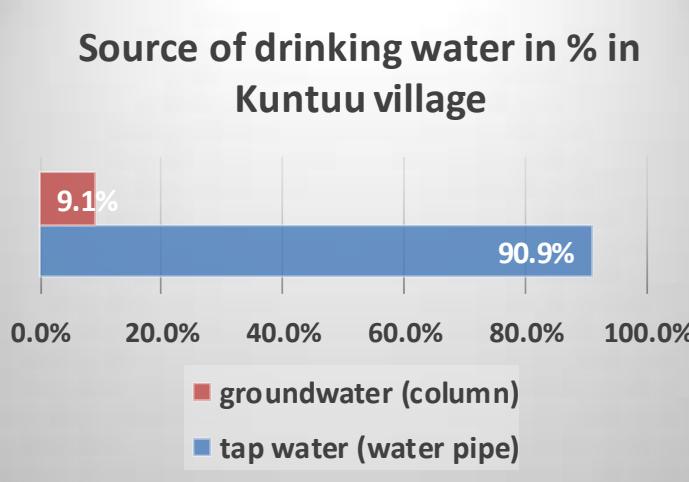

Drinking water source in % in Boroldoi

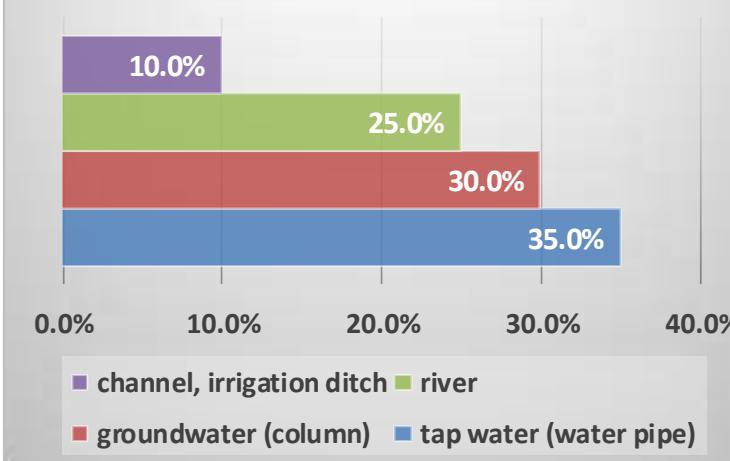

Drinking water source in % in Oirondu village

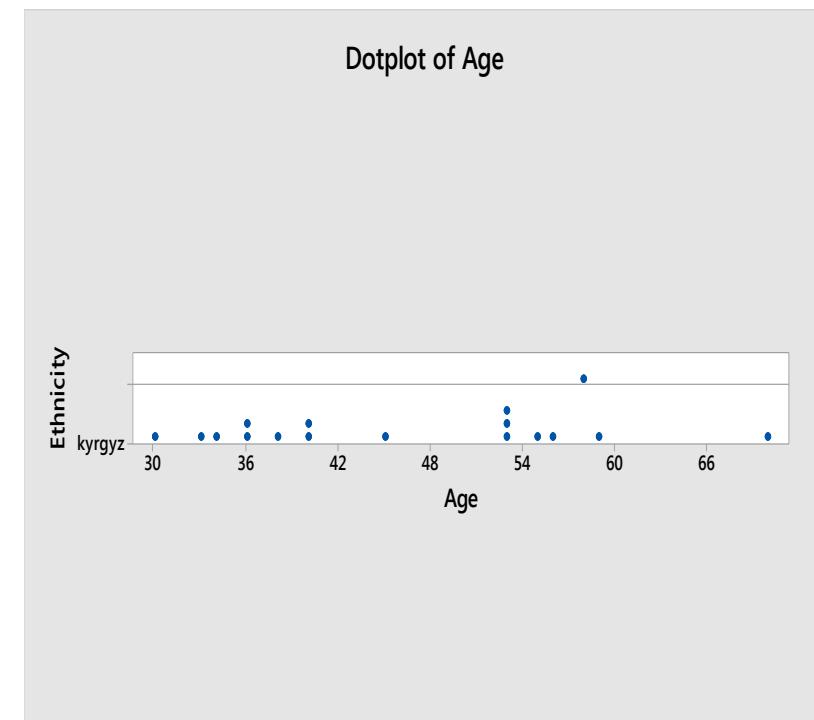

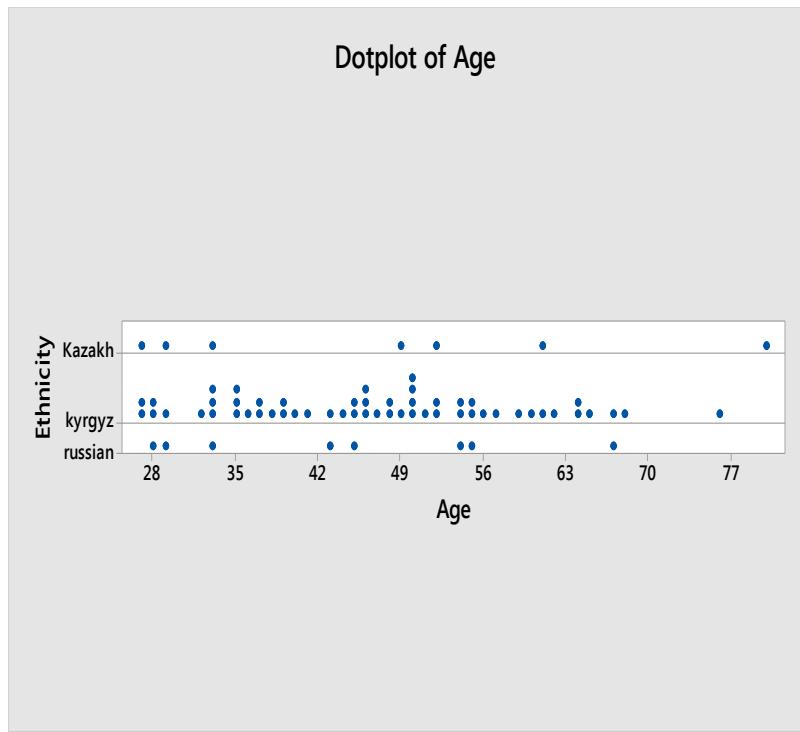

Source of drinking water in % in Kuntuu village

Source of drinking water in % in Daroot Korgon

Descriptive statistics of ethnicity and age of respondents in Chui and Chon Alay valley

Conclusion

- Social vulnerability(water issues, food insufficiency) 
- Presence of poor and rich class social disputes and tensions
- High dependence on agriculture and cattle breeding
- Poor quality of institutional and government support

ENVIRONMENTAL ASSESSMENT OF THE KOFARNIHON RIVER BASIN USING SATELLITE IMAGES

MUNIM ABDUSAMADOV, ANVAR KODIROV,
ZAMONIDDIN NASRIDDINOV, JAFAR
NIYAZOV

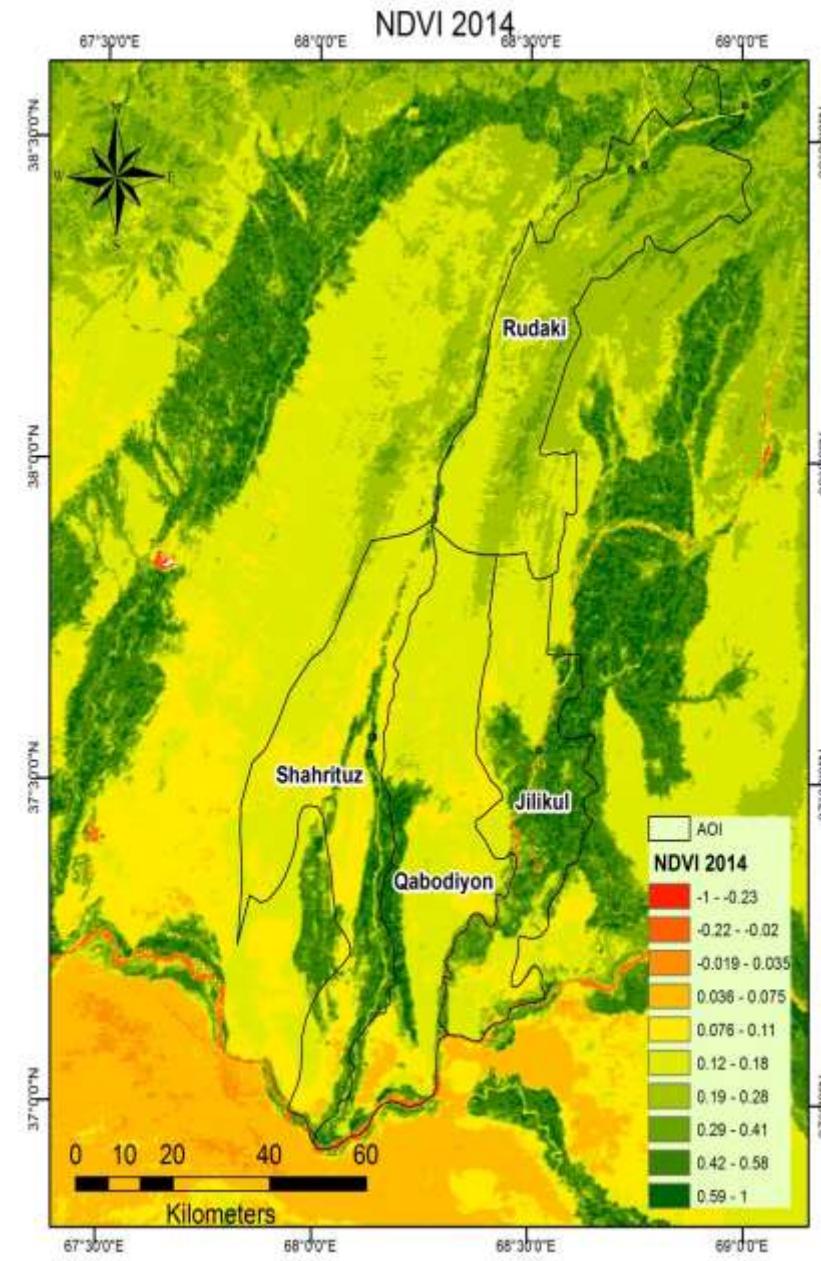

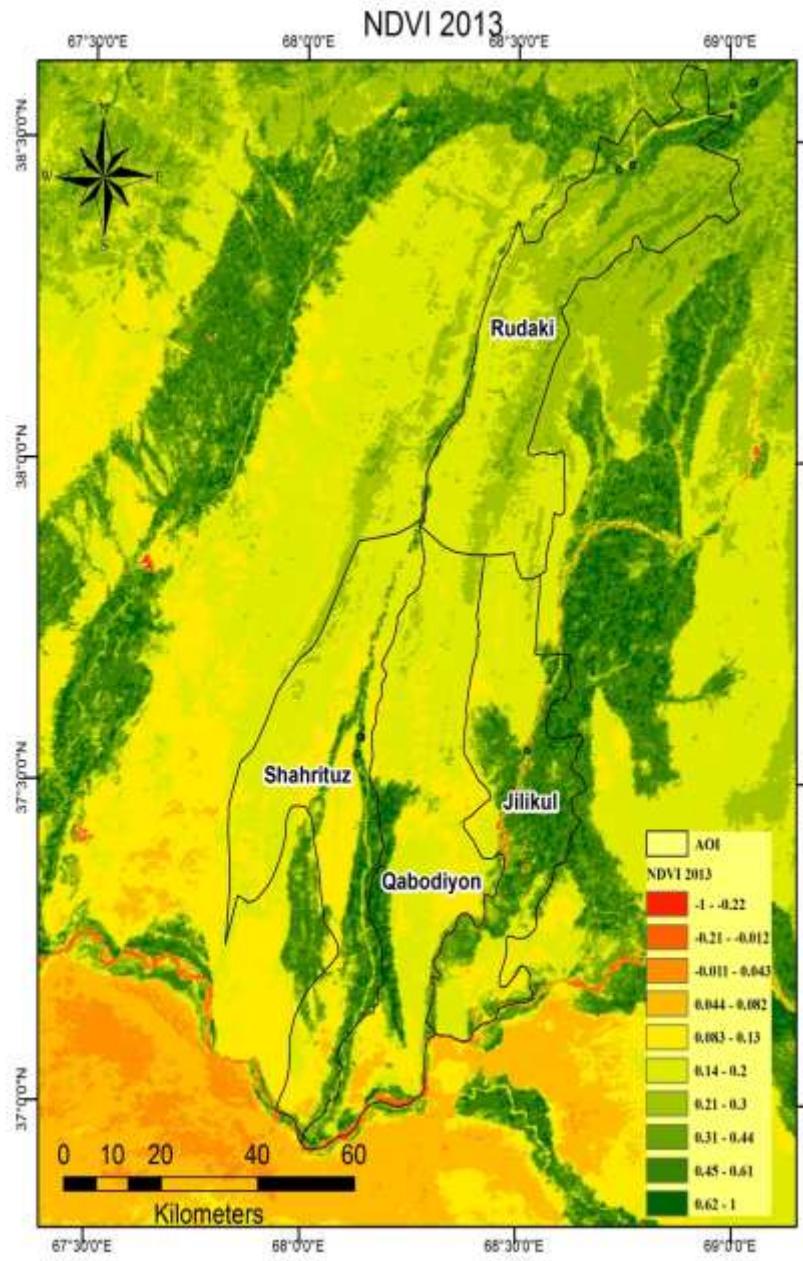

PEER NAS USAID «Integrated Water Resource Management and Strategic Environmental Assessment of Kabul and Amu Darya Rivers», American University of Central Asia, Bishkek, Kyrgyz Republic, on 10-15 October, 2018

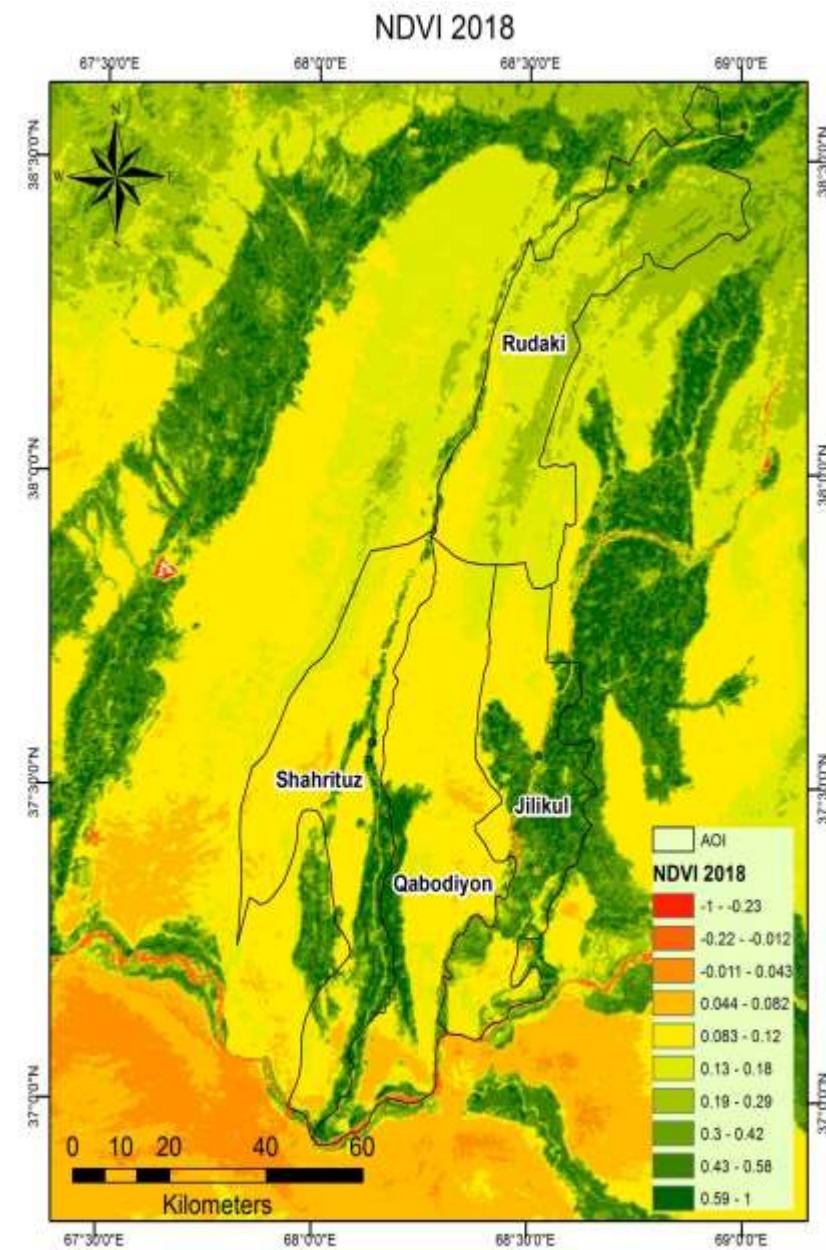

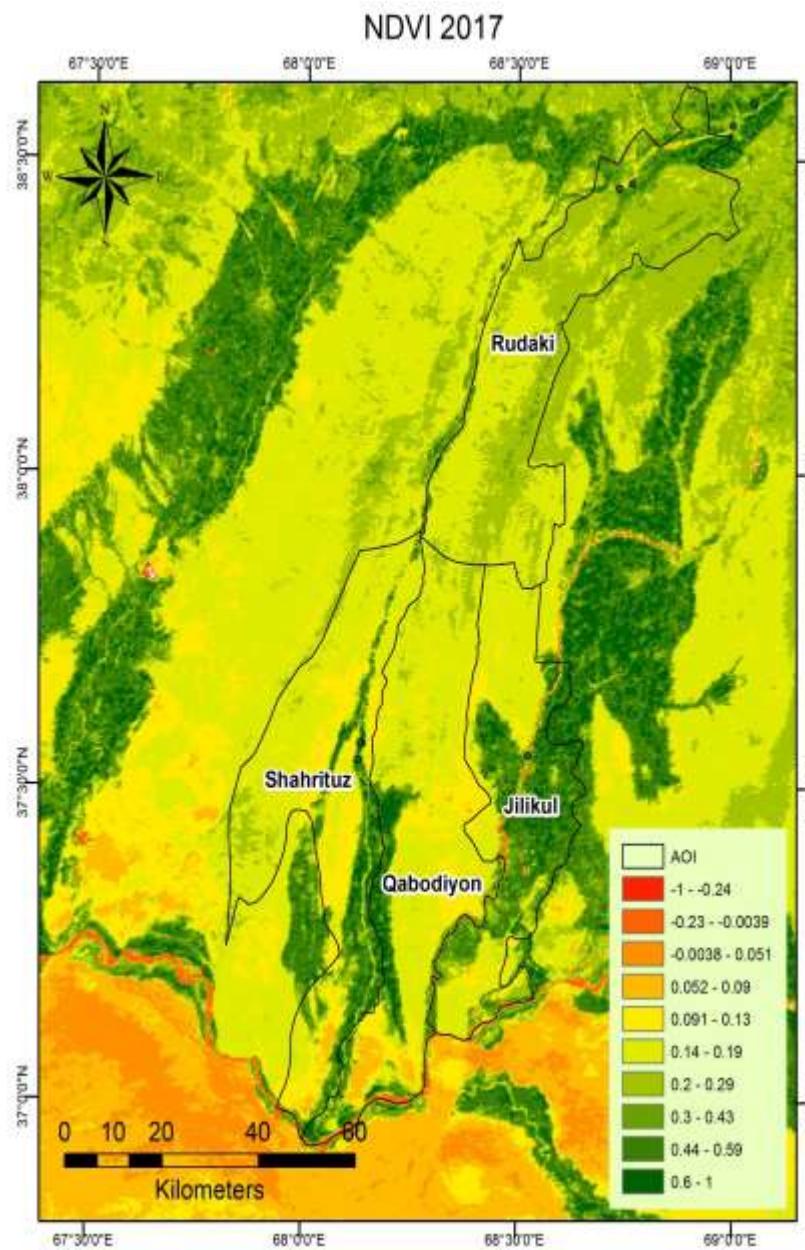

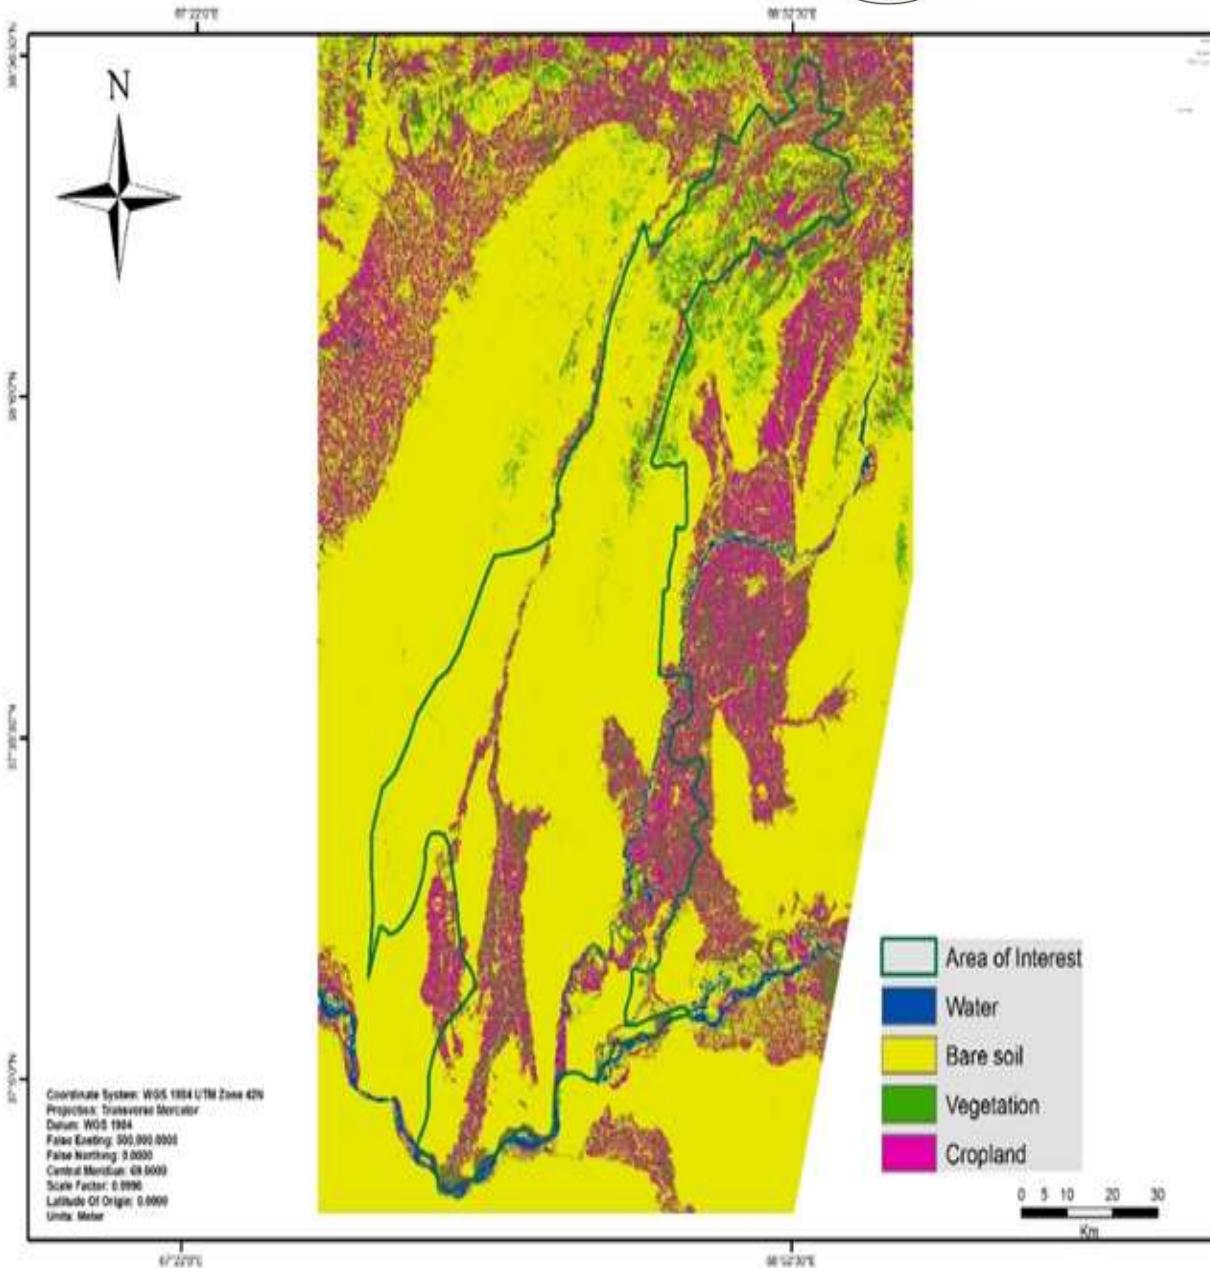

The objects detection and definition on the Earth's surface useful to combine different bands to produce so-called images in natural colors or pseudo-color images. The semi-automatic extraction of objects of interest (vegetation, water bodies etc.) includes the construction of the ratio of different bands. The allocation of vegetation-covered areas by calculating the normalized difference vegetation index NDVI is widespread:

$$NDVI = \frac{NIR - RED}{NIR + RED},$$

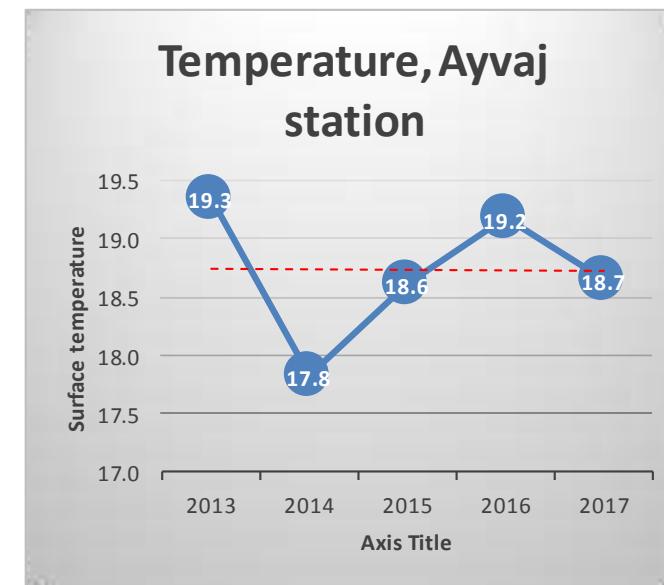

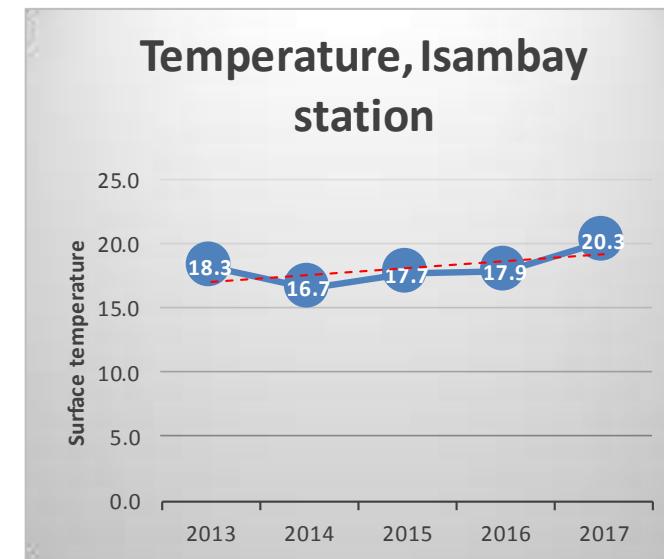

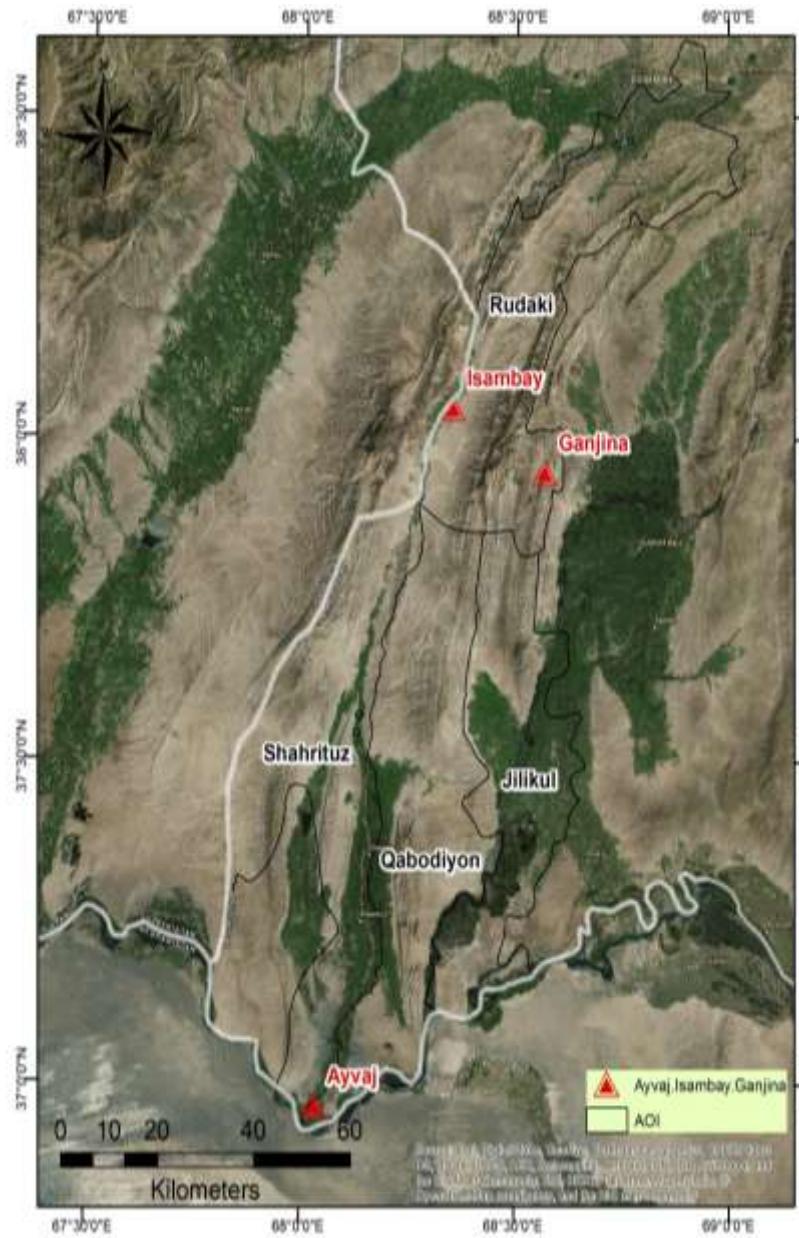

For the Landsat 8 images NIR is band 5, and RED is band 4. The range of NDVI values varies from -1 to 1, with the highest values indicating lush vegetation and the lowest values indicating rare vegetation cover. NDVI values should be classified in order to clearly identify vegetation-covered areas. Should define equal values for the classified NDVI visualization separately for each satellite image scene to calculate the difference between them.

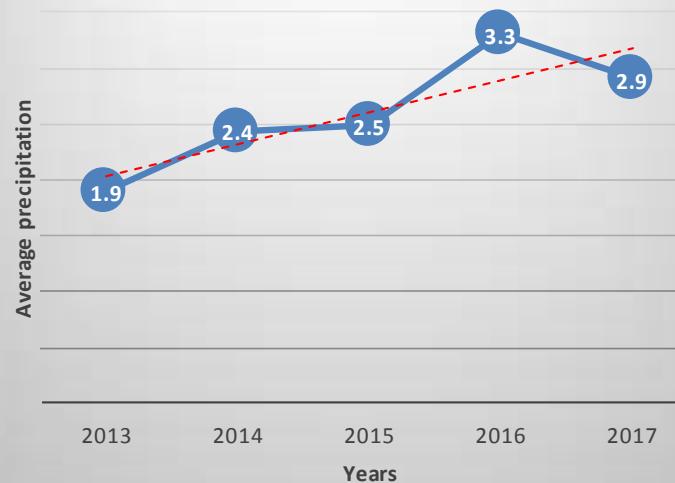

Land cover (LC) can be defined as the “observed (bio) physical cover of the earth’s surface” and is a synthesis of the many processes taking place on the land. It reflects land occupation (and its transformation) by various natural, modified or artificial systems and to some extent how these systems affect the land. LC is one of the most easily detectable indicators of human intervention on land. Because it can change quickly over time, it is also a good proxy for dynamics of the earth surface resulting from a variety of drivers and factors.

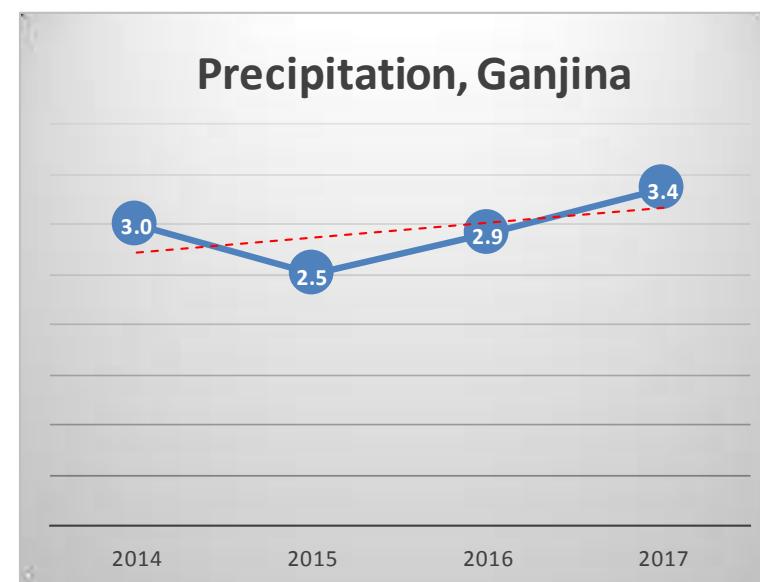

Precipitation , Ayvaj

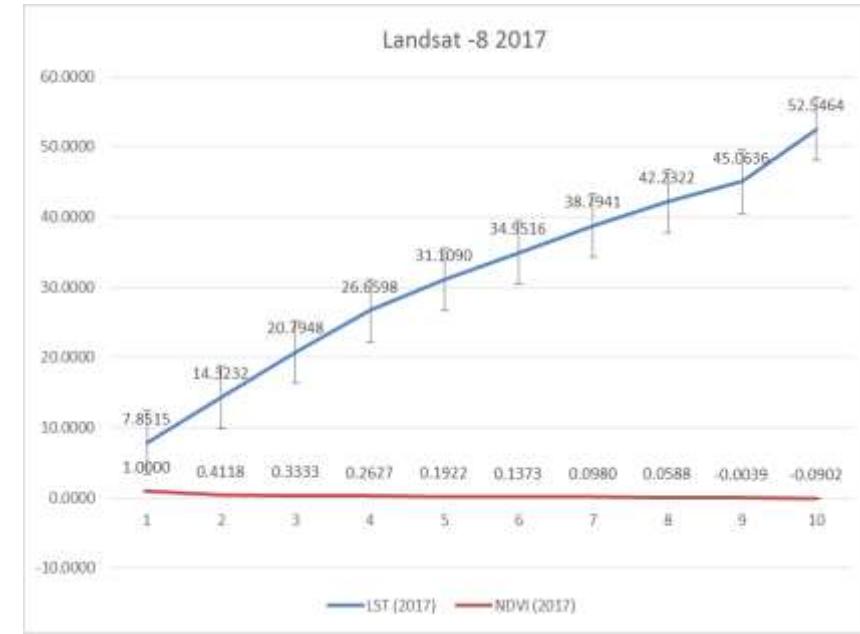

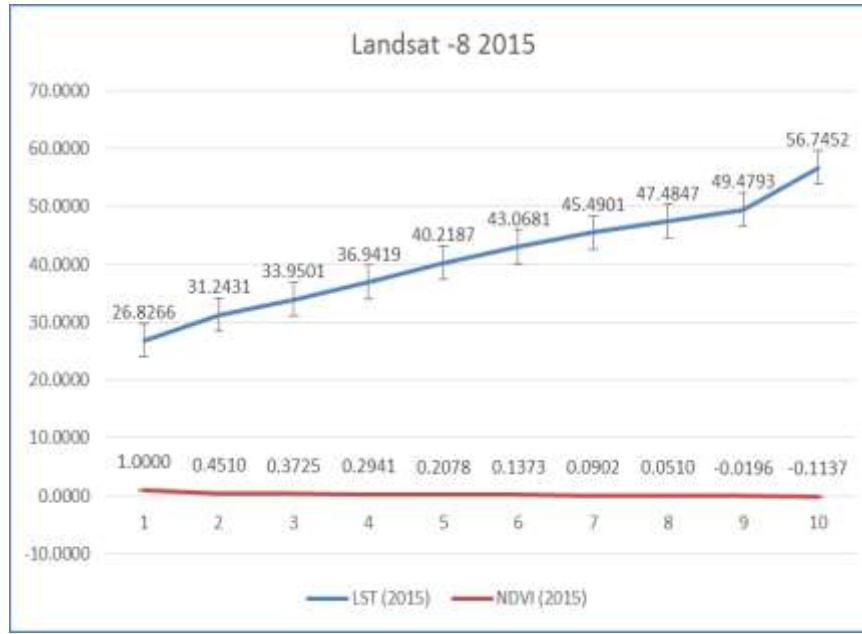

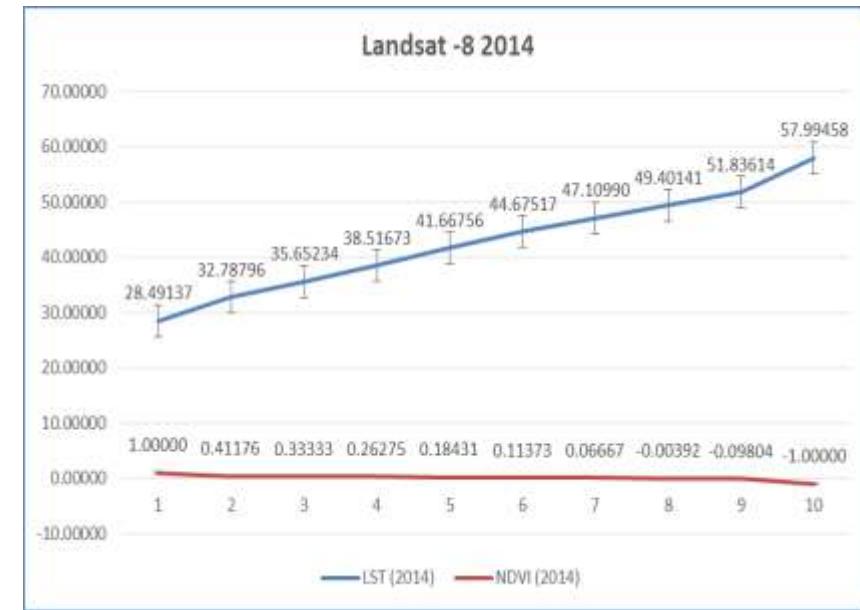

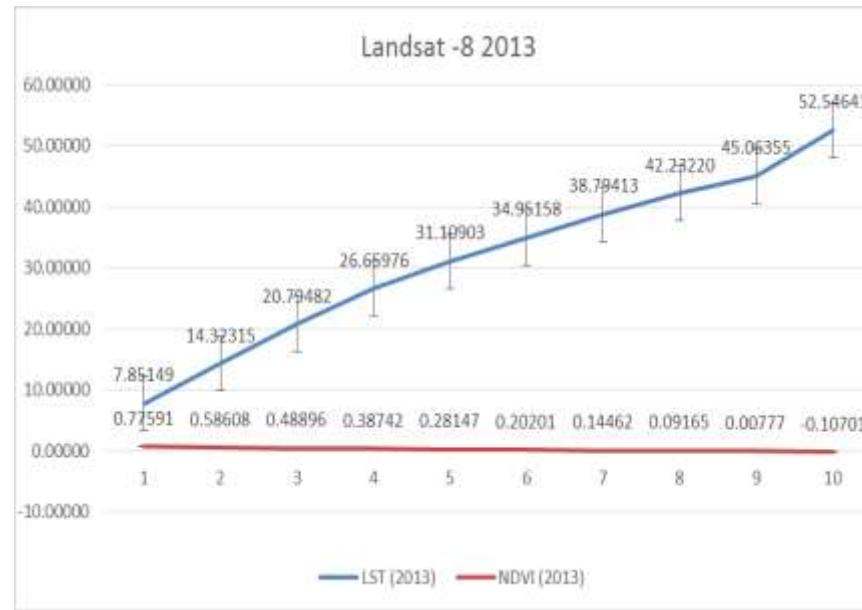

Precipitation, Isambay

Precipitation, Ganjina

USAID
FROM THE AMERICAN PEOPLE

CONCLUSION

Studies conducted in the Amu Darya river basin have shown the need to introduce water-saving irrigation technologies, integrated water resources management, improvement of the ecological status of Transboundary Rivers, socio-economic living conditions of the population and improve the efficiency of irrigated land use.

In addition, specific recommendations for the study, planning and implementation of the effective use of water resources of the partner countries will be developed and presented.

Conclusion and Recommendations

- **Land Cover:** Limitation of data (Calculated and Recorded) but it is on the way.
- General Project Implementation?
- Water resources protection; conservation and management.
- Rain water harvesting; Waste water treatment and reuse.
- ❖ ***Climate Change Mitigation and Adaptation:***
 - Ecosystem based approaches: water resources management and sustainable energy use.
 - Green Energy: Developing hydropower, solar, biomass, hydrothermal, wind energy resources no fossil fuel energy use.
- ❖ ***Joint work of the Amu River Basin countries on:***
 - Mitigation, adaptation and environmental management.
 - Capacity assessment, collection and sharing existing data, analyzing and interpretation of the data.
 - Transboundary water resources conservation and management.
